A symposium was held to discuss the needs for radioactivity standards in environmental monitoring programs concerned with population radiation exposure. Papers were presented on 'Status of Decay Schemes,' 'Some Activities and Needs for AEC Regulatory in the Use of Radioactivity Standards,' 'Standards for Environmental Studies,' 'Program and Activities of the Quality Assurance Branch, NERC-Las Vegas,' 'Activities of Commercial Radionuclide Producers,' and 'Radionuclide Metrology and Quality Assurance.' The presentations indicated that numerous radioactivity standards and aids for correctly utilizing them were available. New needs, however, had arisen recently because lower levels of ambient radioactivity must be measured by many more groups due to requirements that population radiation exposure from nuclear power production be as low as practicable. Based on the presentations and resulting discussions, the following actions were recommended: (1) Establish a focal point for systematically planning activities to meet cited needs for decay schemes, specific standards, analytical methods, and quality assurance programs; (2) Develop a clear chain of traceability to the National Bureau of Standards; (3) Prepare guides for standardizing radiation detection and maintaining quality control; and (4) Train qualified analysts to obtain satisfactory analytical results. SCIENTIFIC AND TECHNICAL ASSESSMENT REPORT ON MANGANESE.
Environmental Protection Agency, Research Triangle Park, N.C. Office of Research and Development.
Available from the National Technical Information Service, Springfield, Va 22161 as PB-242 291, $4.50 in paper copy, $2.25 in microfiche. Report EPA-600/6-75-002, April 1975. 56 p, 3 fig, 30 tab, 124 ref. 1AA001; ROAP No. 26AAA.

Descriptors: *Manganese, Reviews, Measurement, Evaluation, Control, Path of pollutants, Toxicity, Environment, Ecology, Air pollution effects.
Identifiers: Manganism.

A review and evaluation are presented of the current knowledge of manganese in the environment as related to possible deleterious effects on human health and welfare. Sources, distribution, measurement, and control technology are also considered. Manganese is associated with small particles in the air. Concentrations measured in ambient air averaged 0.1 microgram/cubic m3 (annual) with a maximum of 8.3 microgram/cubic m (annual) near a large source. In Norway, a form of pneumonia was attributed to airborne manganese in a community where concentrations were measured at 46 microgram/cubic m3. Manganese poisoning characterized by progressive central nervous system deterioration has occurred under occupational exposure but apparently not from atmospheric exposure. Control of fine particulate emissions should reduce manganese emission considerably. (EPA)

ANALYSIS OF HYDROCARBONS IN MARINE ORGANISMS: RESULTS OF IDOE INTERCALIBRATION EXERCISES,
Woods Hole Oceanographic Institution, Mass.
J. W. Farrington, J. M. Teal, J. G. Quinn, P. L. Parker, and K. Winters.
Available from the National Technical Information Service, Springfield, Va 22161 as PB-238 459, $3.50 in paper copy, $2.25 in microfiche. Woods Hole Oceanographic Institution Contribution Number 3353, Sept, 1974. 10 p, 3 tab, 5 ref.

Descriptors: *Analytical techniques, *Organic compounds, *Pollutant identification, *Methodology, *Gas chromatography, Laboratory tests.
Identifiers: International Decade of Ocean Exploration, Intercalibration, Accuracy, Tissue analysis, Squalene, Pristane.

Intercalibration exercises conducted as part of the International Decade of Ocean Exploration's baseline studies of ocean pollutants provide an assessment of the precision and accuracy of analyses of marine organisms for hydrocarbons. No methods were specified for the analysis. In all cases, the hydrocarbons were separated from other lipids by column or thin-layer chromatography and then analyzed by gas chromatography. One intercalibration exercise involved the analysis of a tuna meal sample provided as a working intercalibration sample through the courtesy of the National Bureau of Standards. Three laboratories reported the sample as containing 29.5 to 49.0 micrograms of hydrocarbons not resolved by medium resolution gas chromatography columns/gram dry weight of tuna meal. These represent petroleum hydrocarbons by the gas chromatography criteria for a first screening of samples to detect petroleum hydrocarbons. Four laboratories reported pristane concentrations of 1.9, 3.0, 5.9 and 2.0 micrograms/gram dry weight of tuna meal. Results of analysis for individual n-alkanes are also reported. (Katz)

APPENDICES TO: SURVEY STUDY TO SELECT A LIMITED NUMBER OF HAZARDOUS MATERIALS TO DEFINE AMELIORATION REQUIREMENTS,
Little (Arthur D.) Inc., Cambridge, Mass.
W. L. Lyman, L. Nelson, L. Partridge, A. Kalelkar, and J. Everett.
Available from the National Technical Information Service, Springfield, Va 22161 as AD-A004 312, $11.75 in paper copy, $2.25 in microfiche. Prepared for: Department of Transportation, U.S. Coast Guard, Office of Research and Development, Washington, D.C. 20590, March 1974. 621 p.

Descriptors: *Hazards, Regulation, *Chemicals, *Standards, *Classification, *Safety, Pollutants, *Chemcontrol, Documentation, Water pollution sources, Water quality control, Evaluation, Pollutant identification.
Identifiers: *Amelioration requirements, Amelioration techniques, *Hazardous substances, Discharges, Risk analysis.

This is the appendix to a work which entailed the categorization of hazardous chemicals according to physical and chemical characteristics that were perceived to be important to the development of amelioration techniques. A total of 400 hazardous chemicals, deemed to encompass most of the critical chemicals in terms of quantity of shipment and the severity of the hazards presented, were associated with each of approximately 30 amelioration categories. A representative chemical was then selected for each category with the intent that it would provide the basis for searching for, evaluating, and developing amelioration methods from each category. The representative chemicals were chosen by assessing the chemical and physical behavior of the chemicals, risk indices, and other practical considerations. Existing response (amelioration) equipment and systems were then

reviewed to determine applicability to each representative chemical and its associate category. Once gaps and deficiencies were determined, conceptual response studies were initiated that resulted in a number of potential amelioration techniques that were considered to warrant USCG-sponsored research and development efforts. CHEMICAL ANALYSIS OF TRACE ELEMENTS IN ICELAND GEYSIRS WITH REMARKS ON MASTIGOCLADUS LAMINOSUS COHN,
Copenhagen Univ. (Denmark). Inst. of Hygiene.
E. Fjerdingstad, K. Kemp, and E. Fjerdingstad.
Archiv fur Hydrobiologie, Vol 74, No 2, p 159-171, October 1974. 10 fig, 3 tab, 39 ref.

Descriptors: *Trace elements, *Algae, *Geysers, Thermal water, *Thermal springs, Spectroscopy, *Chemical analysis, Copper, Zinc, Manganese, Metals, Silica, Iron, Chlorine, Plant morphology, Hot springs, Cyanophyta, Methodology.
Identifiers: *Mastigocladus laminosus, *Transition metals, Bioaccumulation, *Iceland, Geysirs.

Water from Iceland geysers and the dominant thermal alga, Mastigocladus laminosus were investigated for trace elements. Great concentrations of Si, Ca, Fe and Cl were found in both water and algae. The accumulation factors for Cu, Zn, Mn and Ti were high in the algae, while small concentrations were found in the water. It is suggested that these transition metals are of vital importance to the organisms and are probably part of their enzymatic make-up. The morphology of the algae is discussed. (Katz)

A SALINITY CONTROLLER FOR FLOW-THROUGH BIOASSAYS,
Environmental Protection Agency, Gulf Breeze, Fla. Gulf Breeze Environmental Research Lab.
L. H. Bahner, and D. R. Nimmo.
Transactions of the American Fisheries Society, No 2, p 388-389, 1975. 2 fig.

Descriptors: *Design, *Methodology, Technology, *Bioassays, Flow systems, *Salinity, Water quality, Pesticides, Sea water, *Pollutant identification, *Bioassay, Instrumentation.
Identifiers: *Electro-Mechanical device.

An electro-mechanical device was constructed to monitor and dilute seawater to a constant salinity for flow-through bioassays. It was used successfully in pesticide bioassays and required little maintenance. (Klein)
W76-01929

AN ULTRAVIOLET SPECTROPHOTOMETRIC METHOD FOR THE DETERMINATION OF NAPHTHALENE AND ALKYLNAPHTHALENES IN THE TISSUES OF OIL CONTAMINATED MARINE ANIMALS,
Texas A and M Univ., College Station. Dept. of Biology.
J. M. Neff, and J. W. Anderson.
Bulletin of Environmental Contamination and Toxicology, Vol 14, No 1, p 122-129, July 1975, 1 fig, 2 tab, 15 ref.

Descriptors: Methodology, *Analytical techniques, *Spectrophotometry, *Oil pollution, Organic compounds, *Marine animals, Animal physiology, Clams, Oysters, Mollusks, Technology, *Pollutant identification.
Identifiers: Ultraviolet spectrophotometry, *Naphthalene, Methylnaphthalenes, Dimethylnaphthalenes, Bioaccumulation, Tissue analysis, Crassostrea virginica, Rangia cuneata, *Alkylnaphthalenes.

A direct UV spectrophotometric method for the semiquantitative determination of naphthalene, methylnaphthalenes and dimethylnaphthalenes in oil polluted sea water and the tissues of marine animals is presented. Oysters, Crassostrea virginica, and clams, Rangia cuneata, were used. As little as 0.1 ppm of naphthalene and alkylnaphthalenes were detected in tissues. The detection limits in sea water ranged from 0.01 to 0.05 ppm. (Klein)

5B. Sources Of Pollution

CHEMICAL AND SEDIMENT BUDGETS FOR A SMALL TIDAL CREEK, CHARLESTON HARBOR, S. C.,
South Carolina Univ., Columbus. Dept. of Geology.
J. L. Settlemyre, and L. R. Gardner.
Available from the National Technical Information Service, Springfield, Va 22161 as PB247-081, $4.50 in paper copy, $2.25 in microfiche. South Carolina Water Resources Research Institute, Clemson, Report No 57, May 1975, 56 p, 9 fig, 10 tab, 60 ref. OWRT B-055-SC(4).

Descriptors: *Tidal marshes, *Estuaries, *Sediments, *Water quality, Nutrients, Metals, Surfactants, Coliforms, Organic matter, *South Carolina, Harbors.
Identifiers: *Charleston Harbor(SC), Chemical budgets, Sediment budgets.

Chemical and sediment budgets based on discharge weighted composite samples of flood and ebb flow over 25 tidal cycles indicate that marshes export suspended organic matter and dissolved Si02, P04 and perhaps Fe. Inorganic sediment, surfactants and possibly coliform bacteria are imported and/or degraded. No significant net transport was detected for dissolved Cu, Zn or Pb. The methodology and results of the study are evaluated in terms of physical, chemical and biological processes operative in marshes and in terms of ecological constraints.

L. D. Spraggs, and R. L. Street
Available from the National Technical Inform tion Service, Springfield, Va 22161 as PB247-0 $10.00 in paper copy, $2.25 in microfiche. Tech cal Report No 190, August 1975, 327 p, 83 fig, tab, 48 ref, 5 append. OWRT C-3033(No. 3675)

Descriptors: *Thermal pollution, *Lakes, C puter programs, *Computer models, *Reservo *Numerical analysis, Digital comput *Simulation analysis, Circulation, Ther stratification.

A study was undertaken to develop a three-dim sional numerical model for prediction of the t perature regime and energy transfers in bodie water subjected to thermal loadings. The Nav Stokes equations, a heat energy equation, a p sure equation and a continuity equation are n dimensionalized using three-characteristic le scales. Hence, all physical problems are trea numerically, and mathematically, inside a cube. The Boussinesq approximation is used density variations. Sub-grid-scale turbulence si lation is used with an eddy viscosity hypothe The numerical model follows a Marker-and-C style format in variable placement, etc., was co in FORTRAN, and was implemented on I 360/168 and CDC/7600 computers. Many probl were successfully simulated, including labora tests with wind and in/out flows, and ideal lake forms.

ESTIMATION OF URBAN STORMWA QUALITY IN KALIHI STREAM DRAIN BASIN, OAHU, HAWAII,
Hawaii Univ., Honolulu, Water Resou Research Center.
M. N. Nakamura, and R. H. F. Young.
Available from the National Technical Info tion Service, Springfield, Va 22161, as PB-247 $4.00 in paper copy, $2.25 in microfiche. Tech Memorandum No 45, December 1974. 39 p, 8 16 tab, 41 ref. OWRT A-027-HI(4) 14-31-0 3811.

Descriptors: *Storm runoff, *Pollutant identi tion, *Rainfall intensity, *Land use, Urbaniza *Drainage basin, Isohyets, *Hawaii, Estimatin
Identifiers: *Rainfall duration, Street wa Seasonal storm analysis, *Stormwater qua Kalihi Stream drainage basin(Hawaii).

Urban runoff pollution potential can be link the constituents of street wastes as these w constitute the principal portion of runoff cont nants. This study was an attempt to correlate lution associated with street litter with bas quality data acquired in a previous study of K Stream. Correlations were made between s sweepings quality, length of street, land use, s surface characteristics, and rainfall intensi order to estimate the concentration of pollutan urban stormwater. The overall comparabili obtained estimated with existent stormwater q ty data suggests the possibility of obtaining acceptable quantification of pollution potenti tributable to urban runoff by utilizing proce described. However, the number of assump required leads to some inadequacies as reflect inconsistencies in predicted BOD5 and COD l with actual field data. The good correlatio population density-based formulae for length with actual street lengths indicates a s method for approximating street refuse poll based on loadings per length of curb.

SOURCES AND DISTRIBUTION OF TRACE METALS IN AQUATIC ENVIRONMENTS,
Rensselaer Polytechnic Inst., Troy, N.Y. Fresh Water Inst.
S. L. Williams, D. B. Aulenbach, and N. L. Clesceri.
FWI Report 74-25. 50 p, 27 tab, 8 ref, Published in 'Aqueous-Environmental Chemistry of Metals,' Alan J. Rubin, ed, Ann Arbor Science Publishers, Inc., Michigan.

Descriptors: *Path of pollutants, *Trace elements, *Metals, *Distribution, Geology, Titanium, Chromium, Manganese, Iron, Cobalt, Nickel, Copper, Zinc, Soils, Rocks, Litter, Atmospheric fallout, Sediments, Precipitation(Atmospheric), Chemical reactions, Biochemistry, Surface waters, Hydrogen ion concentration, Urban runoff, Humus.
Identifiers: *Trace metals sources, Scandium, Vanadium.

Sources of trace metals (scandium, titanium, vanadium, chromium, manganese, iron, cobalt, nickel, copper and zinc) in aquatic environments are rocks, soil, and plant litter of drainage basins, dry and wet atmospheric fallout, and industrial and municipal discharges. Metal concentrations depend on the source and chemical and biological nature of receiving waters. Oligotrophic mountain lakes and streams generally contain more metals in surface waters than slower-moving waters with highpH and dissolved salt concentrations. The higher metal concentrations are usually due to larger quantities of humic substances which solubilize metals and to low quantities of dissolved salts which precipitate metals. Streams flowing through sedimentary limestone regions often pick up more metal by erosion or leaching than streams flowing over granite. High local metal concentrations often occur in eutrophic, polluted waters due to acid or strong reducing environments coupled with metal introduction from sediments exposed to reducing environments or from industrial and municipal discharges. High local metal concentrations decrease with distance from polluting source due to chemical and biological reactions. Metal concentrations in oligotrophic, eutrophic, and polluted rivers and lakes in the United States and foreign countries are given to illustrate their occurrence in surface waters. PERSISTENCE OF ENDOTHALL IN THE AQUATIC ENVIRONMENT,
Wisconsin Univ., Madison. Water Resources Center.
G. V. Simsiman, and G. Chesters.
Water, Air, and Soil Pollution, Vol 4, p 399-413, 1975, 4 fig, 2 tab, 27 ref. OWRR B-016-WIS (17).

Descriptors: *Herbicides, *Aquatic environment, *Persistence, Microbial degradation, Pesticide removal, Dissolved oxygen, Aquatic weed control, Sediments, Pesticide kinetics, Adsorption, *Wisconsin.
Identifiers: *Endothall, Lake Mendota(Wis), Lake Tomahawk(Wis).

In a simulated lake impoundment, 72% of the added endothall persisted in the water for 30 days due to prolonged dissolved oxygen depletion resulting from weedkill. Endothall disappeared rapidly only after restoration of oxygenated and oxydizing conditions; under such conditions little or no endothall was detectable after 60 days. Degradation of endothall was slow in weed-free and quiescent sediment-waters containing abundant overlying water (200 ml water:5 ml sediment), even under aerobic conditions. Slow degradation was detected by the small amount of radioactive carbon dioxide evolution and persistence of intact endothall in the water after two months. When the water volume was reduced (20 ml water:5 ml sediment), there was a 25-fold increase in endothall degradation in Lake Mendota, Wisconsin, (a eutrophic hard-water lake). In Lake Tomahawk (an oligotrophic soft-water lake) degradation was slow, indicating that either the sediment contained low numbers of endothall-degrading microorganisms or rapid adsorption decreased herbicide availability for microbial decomposition. This study demonstrates that endothall--although degradable microbiologically--can persist in heavily weed-infested waters if anaerobiosis limits the activity of microorganisms. This may be a significant consideration when treating heavily weed-infested ponds or lakes into with endothall where complete stripping of DO is likely to occur. (Buchanan-Davidson--Wisconsin)
W76-01658

EVALUATION OF GEOTHERMAL ACTIVITY IN THE TRUCKEE MEADOWS, WASHOE COUNTY, NEVADA,
Nevada Univ., Las Vegas. Center for Water Resources Research.
R. L. Bateman, and R. B. Scheibach.
Available from the National Technical Information Service, Springfield, Va 22161, as PB-247 297, $4.00 in paper copy, $2.25 in microfiche. Nevada Bureau of Mines and Geology, Report No 25, 1975. 38 p, 22 fig, 4 tab, 33 ref, 2 append. Published by Mackay School of Mines, Univ of Nevada, Reno. OWRT A-056-NEV (1) 14-31-0001-4028.

Descriptors: Thermal Springs, *Geothermal studies, *Thermal water, Trace elements, *Nevada, Evaluation, Groundwater, Wells, Beneficial use.
Identifiers: *Truckee Meadows(Nev).

This study describes occurrences of geothermal activity within Truckee Meadows area of Washoe County, Nevada, and discusses the potential for utilizing geothermal resources for residential heating. Probable effects of thermal waters on overall ground-water conditions under a pattern of increasing development within the basin are estimated. All chemical quality and temperature data for thermal and non-thermal ground waters were assembled and subjected to various forms of analysis. Results were used to precisely delineate areas of geothermal occurrence and assess the probable results of induced mixing of poor-quality thermal and good-quality non-thermal ground waters. Past and present utilization of the local geothermal resource were inventoried and evaluated. The most freqent present use is for single residence heating employing geothermal wells and simple heat-exchanger systems. Approximately 32 dwelling units and 3 commerical buildings are heated in this manner. This research indicates that space heating is the most practical beneficial use of the geothermal resources in the Truckee Meadows, and that further expansion of this use is

feasible under present technology. (Fallon-Nevada)
W76-01683

HEAVY METAL (CU, PB, ZN, CD, NI, AS, HG) ADDITIONS TO SURFACE WATERS, STREAMS SEDIMENTS AND SELECTED AQUATIC LIFE IN THE MERAMEC PARK RESERVOIR DRAINAGE BASIN, MISSOURI,
Missouri Univ., Rolla. Dept. of Geology and Geophysics.
P. D. Proctor, T. Butz, and B. Sinha.
Available from the National Technical Information Service, Springfield, Va 22161, as PB-247 310, $4.50 in paper copy, $2.25 in microfiche. Missouri Water Resources Research Center, Columbia, Completion Report, July 29, 1975. 44 p, 5 fig, 17 tab, 17 ref, 5 append. OWRT A-072-MO (1) 14-31-0001-4025 and 5025.

Descriptors: *Heavy metals, *Water quality, Surface waters, *Sediments, Aquatic life, Copper, Lead, Zinc, Cadmium, Nickel, Arsenic, Mercury, *Missouri, Reservoirs, *Path of pollutants, *Pollutant identification.
Identifiers: *Meramec River(Mo), *New Lead Belt(Mo), Meramec Park Reservoir Basin(Mo), Barite, Galena.

Heavy metal content of surface waters, stream and bank sediments, and selected aquatic life were determined for five distinct drainage areas in the 1475 square mile Upper Meramec River Basin. A planned reservoir will recieve water and sediments from fringe mining areas producing lead, copper, zinc, cadmium, and barite. Heavy metal content in surface waters is in low parts per billion and mainly meets US Public Health Service standards for drinking water. Cadmium locally approaches the upper limit of 10 ppb at six sample sites. Lead and cadmium content in waters are highest in drainage from the New Lead Belt fringe. Mercury is less than 0.1 ppb for all areas. Two sets of stream sediments from 55 and 69 sample sites, respectively, were analyzed for acid leachable heavy metal content. Leachable heavy metal con tent is several orders of magnitude greater than for water, except for mercury. The sediments from the fringe of the New Lead Belt have the highest average content of lead, copper, zinc, cadmium and nickel. Highest anomalous values occur in this same drainage area, followed by sediments from the fringe of a barite - galena mining area on the east of the basin. Selected aquatic life has heavy metal content and distribution patterns similar to the stream sediments. Effect of entrapment of acid leachable heavy metal content in stream sediments in a reservoir environment is unknown, as also the effect on associated plants and food-chain relationship to other organisms. Monitoring of the water-sediment environment is recommended when and if the reservoir is completed.

THE EFFECTS OF REGIONAL DEVELOPMENT ON THE ILLINOIS RIVER ENVIRONMENT,
Oklahoma State Univ., Stillwater. School of Civil Engineering.
R. N. DeVries, and D. F. Kincannon.
Available from the National Technical Information Service, Springfield, Va 22161, as PB-247 279, $6.75 in paper copy, $2.25 in microfiche. Oklahoma Water Resources Research Institute, Stillwater, Completion Report, (1975). 164 p, 37 fig, 25 tab, 56 ref, 3 append. OWRT A-058-OKLA (1) 14-31-0001-5036.

Descriptors: *Water quality, *Land use, *Waste assimilation capacity, Oklahoma, Arkansas, *Regional development, Low flow, Data collections, Model studies, Water pollution sources.
Identifiers: *Illinois River(Okla-Ark).

Little water-quality data exist for the scenic and popular Illinois River Basin in Oklahoma and Arkansas, making it impossible to predict the impact of regional developments on the basin. Preliminary studies were made to determine the water quality and quantity characteristics of the river and its tributaries, the assimilative capacity of the river, and the present land use pattern. A statistical analysis of the low flows at gaging stations on the Illinois River, Flint Creek and the Barron Fork was made. Allowable organic waste loadings were investigated and modeled. The National Weather Service River Forecast System's streamflow simulation model was fit to the existing basin data. This model will be used in future studies to determine the correlation between quality and quantity. All available water quality data were analyzed along with additional field quality data obtained in 1975 at selected locations. Land use information was obtained using ERTS. The present water quality of the basin is excellent. In order to maintain this quality, models must be developed to predict environmental changes that result from development within the basin.
W76-01690

FATE OF NITROGEN IN SEWAGE EFFLUENT APPLIED TO SOIL,
Agricultural Research Service, Phoenix, Ariz. Water Conservation Lab.
J. C. Lance.
Journal of the Irrigation and Drainage Division, American Society of Civil Engineers, Vol 101, No IR 3, p 131-0144, September, 1975. 2 fig, 1 tab, 32 ref.

Descriptors: *Nitrogen, *Nutrient removal, *Sewage disposal, *Sewage effluents, *Water reuse, Nitrogen compounds, Fertilizers, Environmental sanitation, Sewage treatment, Waste water disposal, Sanitary engineering, Sewage, Filtration, Water conservation, Irrigation water, Water spreading, Irrigation, Infiltration.

Sewage water is generally applied to land in 3 types of application systems: low-rate or irrigation systems, high-rate land filtration, and overland flow or spray-runoff. Each of these systems will remove nitrogen from wastewater if the right soil is selected and the system is properly managed. If areas of crop land are located near the treatment plant, the sewage effluent nutrients can help pay for the treatment. Nitrogen can be removed with a much smaller land area by using a high-rate land filtration system and managing it to promote denitrification. Sewage water could also be applied at high infiltration rates, removing most of the organic matter and harmful microorganisms but not the nitrogen, and then be collected with drains or pumped from the groundwater for unrestricted irrigation use. The overland flow system can be used on soils with a very low permeability where no other land treatment could be used. It could also be used as the sole sewage treatment for some small communities. (Robinett-Arizona)

SOURCES OF POLLUTION FROM MILITARY INSTALLATIONS, PART II,
Rensselaer Polytechnic Inst., Troy, N.Y.
L. K. Wang, J. G. Michalovic, R. G. Ross, and V. J. Ciccone.
Water and Sewage Works, Vol 122, No 8, p 69-71, August, 1975. 12 tab, 21 ref.

Descriptors: *Waste water(Pollution), *Water pollution sources, *Pollutant identification, Oil, Detergents, Storm runoff, Phenols, Chemical oxygen demand, Biochemical oxygen demand, Mathematical estimating equations, Flow rates.
Identifiers: *Military installations, Combined wastes, *Air Force bases, Washrack waste water, Total organic carbon(TOC).

Various waste water streams generated from military bases were analyzed and identified. Washrack waste waters are divided into two separate groups: materials in dirt films, such as soil, grease and oil; and detergents, soaps and solvents. General characteristics of waste waters are very similar despite the wide variability in differences of operation from installation to installation. Characteristics of various combined waste streams were studied. The chemical composition of a specific combined waste stream can be mathematically estimated if the quantity and the percent flow of each participating stream are known. Flow meters can be used to measure the flows of each participating waste stream at different times of day so that the combined waste waters may be estimated. The feasibility of this is subject to further field investigations. (Pinto-FIRL)

CONTAMINANTS IN RAINWATER AND THEIR RELATION TO WATER QUALITY, PART I,
Suffolk County Dept. of Environmental Control, N.Y.
J. A. Frizzola, and J. H. Baier.
Water and Sewage Works, Vol 122, No 8, p 72-7 August, 1975. 1 fig, 2 tab.

Descriptors: *Rainwater, *Groundwater, *Water quality, Evapotranspiration, Pollutants, New York, Precipitation(Atmospheric), Analytic techniques, Water pollution sources, Water pollution effects.
Identifiers: Long Island(NY).

The effect of rainwater quality on groundwater Long Island is discussed. Long Island's sole wat supply is groundwater, and the sole source of t groundwater is precipitation. Under natural con tions, about 50% of the precipitation is lost, main due to evapotranspiration, before it could becor groundwater. The final quality of the groundwat is due not only to trace substances that may picked up by rainwater in the atmosphere, but al by the hydrogeological processes that take pla between the surface and the saturation point of t ground. Natural processes include: evapotrai piration, absorption, adsorption, and ic exchange. Unnatural processes, termed polluti effects, include sources such as fertilizers, ce pools, leachate, and urban runoff. Precipitati study has experienced a resurgence lately, and t U.S. Geological Survey has developed a netwo of testing stations in New York State. The two s tions discussed are Mineola and Upton in Lo Island. To investigate the effects of lawn a garden fertilizers on groundwater the Suff County Department of Environmental Control up a testing station at Medford, which is a t area. Two types of samples are taken: a b monthly sample, and a sample of each precip tion event. Data analyses of samples were c cerned with pH, nitrate, ammonia, sulfate, to nitrogen and chloride to sodium ion ratios, al with other ion tests. (Pinto-FIRL)

hysical-mathematical model was derived for an river systems, emphasizing the effects of ie on biochemical oxygen demand and disved oxygen. The model was particularly igned for shallow and narrow rivers such as se in Japan. Quantitative analyses of daily iation of dissolved oxygen by algae and of ond stage BOD were performed. Second stage D was determined by the adsorption structure algae, water velocity, water temperature, and quantity of the adsorbed algae on the river bed. e overall rate of photosynthesis of algae and the piration rate were determined by illumination l dissolved oxygen, respectively, and by conits which depend on the physiological condiis of the algae. The physical-mathematical dels for BOD and DO balances were then rived by using the above parameters and the w conditions of the river. (Su-FIRL)

LASSIFICATION OF MODELS TO TIDAL ATERS,
onash Univ., Clayton (Australia). Dept. of echanical Engineering.
B. Hinwood, and I. G. Wallis.
urnal of the Hydraulics Division, Proceedings of merican Society of Civil Engineerers, Vol 101, o HY10, p 1315-1331, October, 1975. 1 tab, 141 f.

escriptors: *Waste water disposal, *Mixing, Mathematical models, *Estuaries, Classification, ath of pollutants, Water pollution sources.

he development and direction of a water quality rogram for estuaries and tidal inlets requires a odel to predict the mixing and movement of astes discharged into the water. The models vailable are discussed in terms of the representaons and simplifications used, and the range of onditions under which each model is satisfactory. he models all assume the wastes are miscible eutrally buoyant. The three general approaches o modelling water and waste movement include hysical hydraulic models, passive electrical nalog, and mathematical models. A numerical olution of the partial differential equations that escribe water movement and pollutant transport usually the most productive model. Only numerical models are considered in this discussion. The lassification scheme presented is based on the umber of spatial dimensions, the reference frame sed, and the degree to which the hydrodynamic rocesses are included in any model. The factors overning the choice of a model for a particular inestigation include: the use to be made of the nodel as part of the total investigation; the esources available for the study; the nature of the wastes; and, the nature of the estuary and its oundaries. The answers to these questions permit he selection of the appropriate type of model. The lassification table will then indicate the models vailable to meet the requirements of the physical situation. THE SIGNIFICANCE OF HYDROGEN SULFIDE IN GROUNDWATER,
E. C. C. Li.
Water and Sewage Works, Vol 122, No 8, p 66-67, August, 1975. 3 tab, 8 ref.

Descriptors: *Anaerobic conditions, *Anaerobic bacteria, *Groundwater, *Analytical techniques, *Hydrogen sulfide, Sulfides, Sulfates, Groundwater resources, Leaching, Water pollution sources, Water quality, Landfills.

Hydrogen sulfide is found in groundwater mainly as a result of anaerobic sulfate reductions. An analysis was made of the concentrations of sulfide in groundwater. Three drilled wells in Oklahoma were sampled; these were located within a sanitary landfill, 0.7 miles upstream from the landfill site, and one mile downstream from the site. Water and mud were collected and analyzed for chemical parameters and for the presence of sulfate-reducing bacteria. It was found that landfill groundwater and downstream groundwater were in reducing states with an anaerobic environment; upstream groundwater was also in a reducing state and had a micro-aerophilic environment. A relatively high concentration of dissolved sulfate was found in the landfill groundwater, indicating that decomposed products containing large quantities of sulfate in the landfill were leaching into the groundwater. Analysis of bottom muds showed that sulfide sulfur was dominant, particularly in the landfill sample and was associated with dissimilatory sulfate reducing bacteria that exist only under strict anaerobic conditions. Since organic matter stagnated and accumulated in the landfill area, most sulfate reduction occurred near the mud surface, causing serious pollution at that location. (Kramer-FIRL)

SOME ENVIRONMENTAL PROBLEMS AND THEIR SATELLITE MONITORING,
Tel Aviv Univ., (Israel). Dept. of Environmental Sciences.
J. Otterman.
Journal of the British Interplanetary Society, Vol 28, No 9/10, September/October, 1975. 5 fig, 38 ref.

Descriptors: *Satellites(Artificial), *Monitoring, Surface waters, Water pollution sources, Oil spills, Land use, Water pollution control, Waste treatment.
Identifiers: Albedo.

Results from the first Earth Resources Technology Satellite in monitoring land and water surface changes are presented. Previous studies utilizing this type of satellite and its imagery have been performed in the fields of agriculture, forestry, hydrology, oceanography, limnology, and pollution studies. The possibilities of modifying the sensors of the ERTS (LANDSAT) series satellites for appropriate environmental monitoring are discussed. Some of the dangers linked to land use pressures and surface pollution, such as climatic modification and severe regional environmental impact, are surveyed. Two areas for which monitoring is necessary are: the determination of land use changes due to overgrazing and how such changes affect albedo and land surface-atmosphere interactions; and the determination of land and water surface pollution, particularly the detection of oil slicks. Satellite monitoring is proposed both for assessing the land use and pollution situations and for introducing and following remedial procedures. (Kramer-FIRL)

THE ROLE OF PLANT RESIDUES IN THE RETENTION OF CADMIUM IN ECOSYSTEMS,
Delaware Univ., Newark. Dept. of Biological Sciences.
G. F. Somers.
Available from the National Technical Information Services, Springfield, Va 22161 as PB-247 556, $4.00 in paper copy, $2.25 in microfiche. Completion Report, July 1975. 24 p, 2 fig, 6 tab, 5 ref. OWRT A-032-DEL(1).

Descriptors: *Cadmium, Forests, *Decomposing organic matter, *Adsorption, *Plant physiology, Water pollution, Ecosystems, *Degradation(Decomposition), Assay.

Both fresh and partially decomposed residues of plant material from an old field, a deciduous hardwood forest and from under pine trees exhibited a high affinity of Cd++. The samples were dried and the degree of adsorption of Cd++ was assayed using 109Cd. Using the theory of multiple equilibria (Klotz, 1953) the total number of Cd-binding sites (n) and the intrinsic association constant (K) were determined. These appeared to fall into two classes with lower values for n and higher ones for K at concentrations of <3x10-4 M Cd++ and the converse being true at higher concentrations of Cd++. Changes in the magnitude of n with litter decomposition appeared to be associated to some degree with changes in 'cellulose' and 'lignin' content. The total quantity of exchange sites corresponded to from 0.016 to 0.331 moles Cd/m2 depending upon source of litter and degree of decompition. It is suggested that such material could have a substantial role in smoothing out ambient surges in Cd++ pollution.

REMOTE SENSING OF COAL MINE POLLUTION IN THE UPPER POTOMAC RIVER BASIN.
Ambionics, Inc., Washington, D.C.
Available from the National Technical Information Service, Springfield, Va 22161, as N74-34817, $4.50 in paper copy, $2.25 in microfiche. NASA Report CR-132529, 1974. 67 p, 7 fig, 6 ref. NASA NAS-1-12673.

Descriptors: *Remoting sensing, *Water pollution sources, *Coal mines, *Mine waste, Mine drainage, Mine acids, Mine water, Acid mine water, Strip mines, Strip mine wastes, Vegetation, Pollutant identification, Satellites(Artificial), Aerial photography, Surveys, *Potomac River.
Identifiers: *ERTS.

The purpose of the program was to investigate the utility of combining data sensed remotely from satellites and aircraft with those obtained by traditional field methods of surface sampling, in a more effective approach to monitoring water pollution caused by mining activities, both active and abandoned. The sparsely settled reaches of the upper Potomac River was selected as the test site. The area is almost devoid of industry except coal mining, lessening the confusing effects of other contributing pollution sources. Active teams of scientists live and work in the area who have provided data on the history, land use practices, all polluting agencies, and the effects of pollution. Sufficient work has been done to determine that while remote sensing in no way obviates the need for traditional grab sample monitoring, in can provide a method for correlating, refining, and making more efficient a total monitoring program. Limitations found included the high probability that the test site will be obscured by clouds or haze during an overflight. (Sims-ISWS)

DETERMINATION OF POINTS OF ENTRY FOR POTENTIAL CONTAMINANTS INTO LIMESTONE AQUIFERS USING THERMAL INFRARED IMAGERY,
Alabama Univ., Huntsville. Center for Environmental Studies.
F. L. Doyle.
Available from the National Technical Information Service, Springfield, Va 22161, as N75-12546, $3.50 in paper copy, $2.25 in microfiche. Interim Report to National Aeronautics and Space Administration, October 31, 1974. 14 p, 4 fig, 5 ref, 1 append. NASA NAS8-30216.

Descriptors: *Remote sensing, *Fractures(Geologic), *Soil moisture, *Thermal radiation, Infrared radiation, Temperature, Limestones, Wastes, Water pollution, Regolith, Bedrock, Aquifers, Soil texture, Weathering, Vegetation, Instrumentation, Density, Fourier analysis, Topography, Thermal capacty.
Identifiers: Hybrid optical/digital data processor, Laser beam, Horizontal bar filter, Imagery, Enhancement.

Research is being conducted to find applications of remote-sensing techniques to groundwater hydrology. The effect of soil moisture on surface temperature and the relationship between soil moisture and groundwater is being investigated. Thermal differences at the earth's surface were recorded over the southwestern part of Madison County and adjacent Limestone and Morgan Counties, Alabama, by a Bendix LN 2 thermal scanner. Relative temperature differences between adjacent areas were evidenced by light and dark gray hues, cooler area being darker and warmer areas lighter. Entry of contaminants into the limestone aquifer is more likely to occur where solution has occured, such as along bedding planes or fractures. In north Alabama, however, the overburden is usually several tens of feet thick, and solution openings are hidden. A moisture differential will exist in the soil profile above a solution opening, as opposed to the profile above and area where no solution opening is present. Ground truth data in the form of soil temperature and moisture was used to corroborate the information of the thermography. Recommended conditions for use of thermal imagery to detect maximum thermal contrast due to soil moisture were outlined. (Visocky-ISWS)

THE DISTRIBUTION OF EXCESS TEMPERATURE FROM THE VIENNA GENERATING STATION ON THE NANTICOKE RIVER,
Johns Hopkins Univ., Baltimore, Md. Chesapeake Bay Inst.
H. H. Carter, and R. J. Regier.
Technical Report 90, Reference 75-5, June 1975. 60 p, 49 fig, 2 tab, 13 ref. ERDA AT(11-1)-3062.

Descriptors: *Thermal pollution, *Powerplants, *Cooling water, *Tidal streams, *Maryland, Temperature, Tides, Estuaries, Measurement, Analysis, Distribution, Path of pollutants, Velocity, Tracers, Diurnal distribution, On-site investigations, Water temperature, Heated water, Discharge(Water), Dye release.
Identifiers: *Nanticoke River(Md).

Temperature and dye tracer data, collected in the Nanticoke River in the vicinity of the Vienna Generating Station during April 1974, were analyzed and interpreted in terms of the distribution of excess temperature as a function of tidal phase. The extent and location of the thermal plume were determined. The analysis showed that over most of the estuary larger lateral temperature gradients resulted from differential solar heating than from the heated water discharge. Considerable recirculation was observed. The maximum recirculation of 24% was observed near the middle of the ebb cycle. Total cooling water flow was estimated from intake and discharge dye concentrations and was found to be about 87% of the rated pump capacity. (Adams-ISWS)

TURBULENT JETS WITH REVERSIBLE BUOYANCY,
Iowa Univ., Iowa City. Inst. of Hydraulic Research.
S. C. Jain, and J. M. Pena.
Journal of the Hydraulics Division, Proceedings of American Society of Civil Engineers, Vol 101, No HY9, Paper 11586, p 1221-1233, September 1975. 6 fig, 16 ref. 3 append.

Descriptors: *Jets, *Heated water, *Turbulent flow, *Thermal pollution, *Lakes, Hydraulics, Analytical techniques, Freezing, Nozzles, Buoyancy, Heat transfer, Mixing, Water temperature, Discharge(Water), Density.
Identifiers: *Submerged jets, Momentum flux, Density deficiency profiles.

Large quantities of waste heat from electric power plants are discharged into natural bodies of water such as lakes, rivers, and oceans. The solutions derived from this study can be used to predict the behavior of warm submerged jets discharging into lakes during winter season when the ambient temperature of the lake is near the freezing mark. Due to the peculiar variation of the density of water at low temperatures, the behavior of a warm water jet is different from that of a buoyant jet in which the density can be assumed to be a linear function of the temperature. The problem was analyzed by employing the integral approach and assuming similarity conditions for velocity and temperature profiles. The nonlinear variation of density with temperature was included in the analysis. Results for the jet trajectory, width, and dilution were presented in graphical form. The jet trajectory was deflected downward for all the initial conditions examined. For the initial jet angles greater than zero, the jet rises to a maximum height due to initial vertical momentum and then starts sinking. The maximum rise of the jet is linearly proportional to the jet Froude number. (Singh-ISWS)

SOME EFFECTS OF CADMIUM ON CONIFEROUS FOREST SOIL/LITTER MICROCOSMS,
National Ecological Research Lab., Corvallis, Oreg.
H. Bond, R. Lighthart, R. Shimabuku, and L. Russell.
Available from the National Technical Information Service, Springfield, Va 22161 as PB-245 035, $4.00 in paper copy, $2.25 in microfiche. Environmental Protection Agency, Report EPA-660/3-75-036, June 1975. 30 p, 9 fig, 1 tab, 30 ref. 1AA006.

Descriptors: *Cadmium, *Coniferous forests, *Forest soils, *Litter, Oxygen, Carbon dioxide, Degradation(Decomposition).

Description and criticism are given of a preliminary design and use of a soil/litter microcosm in which oxygen, temperature and humidity are kept constant and oxygen generation and carbon dioxide and heat evolution rates are monitored. Experiments were performed using four microcosms, one acting as a dead control. For 'identically' prepared and incubated microcosms, the coeff cient of variation was as small as 3.8 percent f carbon dioxide evolution rate and as large as 9 percent for oxygen consumption rates. An adjus ment period of seven to ten days after microcos preparation was necessary to approach relative constant production rates. For microcosms a justed to 10, 30, and 60 percent of field water hol ing capacity, oxygen and carbon dioxide rates a bacterial densities vary directly whereas the fun and actinomycetes varied inversely. For 0.01 pp cadmium amended microcosms and initial stag in the 10 ppm CdCl2 unit, oxygen consumpti was stimulated suggesting respiratory enzyme u coupling while in the later stages the 10 ppm ca mium amended soils reduced both O2 and C respiration by 40 percent. No organismal dens changes due to cadmium were detected; longer e periments might be necessary to detect populati density changes. (EPA)

Descriptors: *Bioindicators, *Sediments, *Sampling, Sewage water, Water quality, Benthos, Biomass, Water pollution sources, Speciation.
Identifiers: *Coastal waters, *Meiofauna, Paranais litoralis, Nitocra spinipes, Amphichaeta sannio, Tachidius discipes, *Baltic Sea.

The influence of sewage on the qualitative and quantitative composition of the meiofauna was investigated on the basis of a number of unscreened live sediment samples taken from three stations in the eulittoral of the Greifswalder Bodden. Although all three localities were largely similar with respect to sediment quality, vegetation, degree of exposure, depth of water and salinity, there were noticeably differences between the sampling areas polluted by sewage and those which were free of pollution. An increase in the abundance of Paranais litoralis and Nitocra spinipes and a decrease in the numbers of Amphichaeta sannio and Tachidius discipes were noticed as the pollution increased. The practical value of indicator organisms for the classification of the waters in shallow inlets and their degree of pollution was briefly discussed with reference to the effort required to measure physical and chemical parameters. STUDIES ON THE TOLERANCE OF YOUNG OF THE YEAR MISSISSIPPI RIVER FISH TO HEATED WATERS,
Wisconsin Univ.--Eau Claire. Dept. of Botany.
V. A. Cvancara.
Available from the National Technical Information Service, Springfield, Va 22161, as PB247-094, $3.50 in paper copy, $2.25 in microfiche. Completion Report, (1975). 21 p, 10 fig, 3 tab, 43 ref. OWRT C-4251 (No 9037) (1).

Descriptors: Freshwater fish, Aquatic animals, Aquatic life, *Juvenile fish, *Thermal pollution, Temperature, *Thermal stress, Bass, Bullheads, Carpsuckers, Drums, Pikes, White bass, Shad, Sunfish, Heated water, Water pollution effects, *Mississippi River, *Water temperature, *Minnesota.

An attempt was made to simulate in the laboratory, Mississippi River water conditions in a one way flow experimental chamber to determine the temperature tolerance of young-of-the-year fish. This parameter was chosen to simulate the environmental conditions that young fish would face in their natural hatching areas when confronted with an actual thermal plume as from the effluent of a large nuclear electricity generating plant. Young-of-the-year of eight Mississippi River species were obtained in sufficient numbers from the study area located near Winona, Minnesota. The temperature at which 50% of the experimental young-of-the-year fish survived the 48 hour test period were as follows: Gizzard shad (Dorosoma cepedianium) 28.5C; Bluegill (Lepomis macrochirus) 28.5C; Northern pike (Esox lucius) 30.8C; Freshwater drum (Aplodinotus grunniens) 32.8C; White Bass (Morone chrysops) 33.5C; Largemouth bass (Micropterus salmoids) 35.6C; Black bullhead (Ictalurus melas) 35.7C. The range of Mississippi River water temperature during July and August of 1973 was 23 to 31 C while the range during July and August 1974 was 22 to 33C. It appears that these young fish during short periods of peak summer temperatures would suffer some heat stress normally and the problem would be compounded if heated effluents were added to the river during periods of high summer temperature.

CHLORINATED SEWAGE EFFLUENTS AND AVOIDANCE REACTION OF STREAM FISH,
Maryland Univ., College Park. Inland Environmental Lab.
C. F. Tsai, and J. A. Fava, Jr.
Available from the National Technical Information Service, Springfield, Va 22161, as PB-247 102, $4.50 in paper copy, $2.25 in microfiche. Maryland Water Resources Research Center, College Park, Technical Report No 35, (July 1975). 59 p, 5 fig, 12 tab, 31 ref. OWRT A-022-MD(2) 14-31-0001-5020.

Descriptors: Sewage effluents, *Chlorine, *Ammonia, Toxicity, Water pollution effects, Lethal limit, *Fish behavior.
Identifiers: *Blacknose dace, *Chloramines, Avoidance index, Activity index, Threshold avoidance concentration, Median avoidance concentration, Latent period, Median avoidance time, Free chlorine.

The behavioral responsed of the blacknose dace to domestic sewage effluents and their toxic constituents, free chlorine, chloramine, and ammonia were investigated. The degrees of the fish avoidance to chlorinated sewage effluents were identical with those to the chloramine solutions and much higher than those to free chlorine solutions. The threshold avoidance concentration for chloramine solutions and chlorinated sewage effluents was 0.17 mg/l and 0.12 mg/l as total chlorine respectively, much lower than 0.58 mg/l for the free chlorine solutions. In a delayed response study, the fish could avoid both chloramine solution and free chlorine solutions as low as 0.07 mg/l. There was initial preference reactions to free chloride solutions, which shifted to avoidance reaction later. The latent period and the median avoidance time were shorter for chloramine solutions than for free chlorine solutions. The results indicate that chloramines are the major constituents of chlorinated sewage effluents, causin the absence or depletion of fish below sewage outfalls by the avoidance behavior of the fish.
W76-01523

TOXICITY OF ROTENONE TO SOME SPECIES OF COARSE FISH AND INVERTEBRATES,
Ministry of Agriculture, Nairobi (Kenya). Water Dept.
B. S. Meadows.
J Fish Biol. Vol 5, No 2, p 155-163, 1973. Illus.

Descriptors: *Rotenone, *Pesticide toxicity, Pesticide residues, Fish management.
Identifiers: Rutilus rutilus, Roaches.

The toxicity of rotenone was determined for 7 spp. of fish and 3 spp. of invertebrates. The results show that there is a marked variation in sensitivity of different species to rotenone. The survival

times of roach Rutilus rutilus (L.) were reduced by a rise in temperature and also by a reduction in water hardness. Temperature affected the rate at which rotenone is degraded; 3 days after being prepared a solution containing 2 mg/l of 5% rotenone was non-toxic to roach over a 7-day period at 20 degrees C, but it was still toxic for at least 11 days at 11.5C. The data are discussed in relation to the use of rotenone in fisheries management.--Copyright Biological Abstracts, Inc.

SUMMERKILL RISK IN PRAIRIE PONDS AND POSSIBILITIES OF ITS PREDICTION,
Fisheries and Marine Service, Winnipeg (Manitoba). Freshwater Inst.
J. Barica.
Journal of the Fisheries Research Board of Canada, Vol 32, No 8, p 1283-1288, 1975, 3 fig, 2 tab, 15 ref.

Descriptors: *Forecasting, *Fishkill, *Potholes, *Risks, Algae, Fish farming, Summer, Chlorophyll, Dissolved oxygen, Light penetration, Secchi disks, Ammonia, Nitrogen, Specific conductivity, Winter, Correlation analysis, Canada.
Identifiers: *Erickson-Elphinstone Area(Manitoba), Aphanizomenon flos-aquae, Microcystis.

Fifty-one pothole lakes in the Erickson-Elphinstone area of Manitoba were studied to obtain criteria for assessing and predicting summerkill risk. Collapses of heavy algal blooms, mostly Aphanizomenon flos-aquae, and subsequent oxygen depletion caused summer fish kills in these ponds. Kills only occurred in ponds where the specific conductance range was 800-2000 micromhos/cm and chlorophyll-a concentration above 100 micrograms/l. Prairie ponds with summer chlorophyll-a maxima of 25-100 micrograms/l developed only moderate blooms of Anabaena, Microcystis, or diatoms in the spring and never exhibited summerkill. Ponds with chlorophyll-a maxima below 25 micrograms/l were usually clear but frequently developed dense bottom vegetation. A practical system for assessing summerkill risk substituted Secchi disk transparency measurements for chlorophyll-a values. Correlations between various parameters indicated that the best correlation was between late winter ammonia nitrogen concentration and maximum chlorophyll-a concentration the following summer. Two summerkill prediction systems are proposed, based on ammonia, dissolved oxygen, and Secchi disk transparencies, enabling prediction of summerkill risk 3 or 9 months prior to fish stocking. The nine month system was more reliabe but more difficult because frequent sampling was necessary. Macrophyte chlorophyll-a concentrations and salinity effects on fish yields should also be considered. (Buchanan-Davidson--Wisconsin)
W76-01653

THE ROLE OF AMINO ACIDS IN THE NITROGEN CYCLE OF LAKE MENDOTA,
Wisconsin Univ., Madison. Water Chemistry Lab.
W. S. Gardner, and G. F. Lee.
Limnology and Oceanography, Vol 20, No 3, p 379-388, 1975, 5 fig, 3 tab, 24 ref. EPA 5 5-T02-WP-00184, EPA 16010.

Descriptors: *Amino acids, *Nitrogen cycle, *Eutrophication, *Wisconsin, Trace elements, Bacteria, Algae, Hypolimnion, Epilimnion.
Identifiers: *Dissolved free amino acids, *Lake Mendota(Wis), Aphanizomenon, Serine, Alanine.

To understand the importance of amino acids in the nitrogen cycle the concentration of dissolved free amino acids was determined in this eutrophic Wisconsin lake. Less than 0.01 micromoles dissolved free amino acids were present; they appeared to be controlled by bacterial uptake. Larger concentrations of combined amino acids were found. Of ten amino acids studied (alanine, valine, isoleucine, threonine, leucine, serine, proline, phenylalanine, tyrosine, and lysine, but not glycine), serine and alanine were most prevalent in the dissolved fraction. Free and combined amino acids showed little variation with season and depth, but the levels of particulate amino acids increased in the epilimnion during the warmer months, when conditions were favorable for algal growth. In the hypolimnion concentrations of amino acids in particulate material were lower than in the dissolved fraction. Daily examination of shore samples suggested that concentrations of dissolved free amino acids generally remained at trace levels, but higher concentrations were observed during a period of rapid algal decomposition after an Aphanizomenon bloom. Shore water samples taken daily 3 m below the lake surface contained lower and more uniform dissolved free amino acid concentrations than samples of surface water. (Buchanan-Davidson--Wisconsin)

COLLAPSES OF ALGAL BLOOMS IN PRAIRIE POTHOLE LAKES: THEIR MECHANISM AND ECOLOGICAL IMPACT,
Fisheries and Marine Service, Winnipeg (Manitoba). Freshwater Inst.
J. Barica.
Verhandlungen Internationale Vereinigung Limnologie, Vol 19, p 606-615, 1975, 11 fig, 1 tab, 19 ref.

Descriptors: *Eutrophication, *Algae, *Potholes, *Mode of action, Lakes, Fish farming, Cyanophyta, Chlorophyta, Canada, Summer, Diatoms, Spring, Oxygen sag, Phosphates, Ammonia, Nitrogen, Phosphorus, Toxins, Shallow water, Fishkill.
Identifiers: *Algal bloom mortality, *Erickson(Manitoba).

The consequences of algal bloom collapses were studied in prairie pothole lakes near Erickson, Manitoba, and especially their effect on fish farming. Massive algal die-offs in the eutrophic lakes consisted of collapses of Aphanizomenon flos-aquae blooms in July-early September of spring collapses of diatom blooms combined with small greens and non-Aphanizomenon blue-greens. Algal biomass reached its exponential phase rapidly with maximum chlorophyll-a and dissolved oxygen, and low Secchi transparency, ammonia, and soluble reactive phosphate, (SRP). Suddenly the algal mass sand, water cleared, dissolved oxygen dropped, and ammonia-nitrogen and SRP increased. After several partial collapses, a total crash occurred and anoxic conditions developed. Non-Aphanizomenon collapses released nitrogen, phosphorus, and ammonia-nitrogen. Ammonia and phosphate were released from lake sediments under anoxic conditions. The cause of algal collapses is not known. Ammonia-nitrogen in summer was inversely proportional to algal biomass; its release following algal collapse was accompanied by reactive phosphate release. Dissolved oxygen, a function of algal biomass, was directly proportional to chlorophyll-a. Primary production in an Aphanizomenon bloom was high. With even partial bloom collapse and dissolved oxygen depletion, respiration processes dominated the water column. After massive collapses, bacterial decomposition under anaerobic conditions can interfere with the entire ecosystem. (Buchanan-Davidson--Wisconsin)

NITROGEN, PHOSPHORUS AND CARBON CYCLES IN A DISTURBED EUTROPHIC ECOSYSTEM,
Fisheries and Marine Service, Winnipeg (Manitoba). Freshwater Inst.
J. Barica.
FWI Reprint No. 373, 20 p, 8 fig, 1 tab, 8 ref. Paper presented at Second International Symposium on Environmental Biogeochemistry, April 8-11, 1975, Canada Centre for Inland Waters, Burlington, Ontario.

Descriptors: *Nitrogen cycle, *Phosphorus, *Carbon cycle, *Cycling nutrients, Carbon, Eutrophication, Algae, Biomass, Chlorophyll, Potholes, Oxygen sag, Diatoms, Ammonia, Phosphates, Dissolved oxygen, Nitrogen compounds, Organic compounds, Cyanophyta, Fish farming, *Canada.
Identifiers: *Erickson(Manitoba), Aphanizomenon flos-aquae, Microcystis, Merismopedia.

Seasonal cycles of nitrogen, phosphorus, and carbon were compared with those of dissolved oxygen and algal biomass (chlorophyll-a) in a eutrophic, prairie-pothole lake in the Erickson area of Manitoba. The lake became anoxic in midwinter due to ice and snow cover. Oxygen depletion of a shorter duration occurred following collapse of heavy summer blooms of Aphanizomenon flos-aquae or Microcystis, Merismopedia, and diatoms. Anoxic conditions caused rapid release of ammonia and reactive phosphate. Ammonia and reactive phosphate were inversely proportional to dissolved oxygen. Dissolved organic nitrogen, phosphorus, and carbon and inorganic carbon varied seasonally due to winter anaerobiosis. Particulate sestonic and dissolved organic nitrogen and phosphorus were major ammonia and reactive phosphate sources. Chlorophyll-a correlated with particulate carbon, nitrogen, and phosphorus. Lake nutrient cycles formed an internal system. Nutrients came from soil enriched with fertilizers and cattle farming, and were regenerated by winter decomposition of plankton and vegetation, creating conditions for blue-green algal blooms the next summer. These blooms governed the lake's oxygen regime. Bacterial oxygen depletion and accumulated algal material caused nutrient cycle disturbances. The nutrient regime determined the algal population; algal decomposition affected the nutrient regime. These phenomena affected water quality and lake suitability for fish survival. THE EFFECT OF OZONE ON THE DISSOLVED ORGANIC SUBSTANCES IN THE WATER OF LAKE CONSTANCE (WIRKUNG VON OZON AUF DIE GELOESTEN ORGANISCHEN SUBSTANZEN IM BODENSEEWASSER),
D. Maier.
Vom Wasser, Vol 43, p 127-160, 1974. 10 fig, 6 tab, 58 ref.

Descriptors: *Organic matter, *Ozone, *Water treatment, *Waste water treatment, Flocculation, Pollutant identification, Lakes.
Identifiers: Constance Lake.

A determination of the characterization of organic substances in the water of Constance Lake before and after ozone treatment was presented. The effects of ozone were measured by summarized parameters of total organic carbon, chemical oxygen demand and ultraviolet spectra. Total acid determination was also made for the ozonized water of the lake. Further detail was given by IR-spectroscopic investigations. The influence of ozone treatment on successive steps of treatment was further studied in terms of adsorption with activated carbon, flocculation, chlorine demand, and the growth of bacteria. SURVIVAL OF ENTEROBIRUSES ON VEGETABLES IRRIGATED WITH CHLORINATED OXIDATION POND EFFLUENTS,
Technion - Israel Inst. of Tech., Haifa. Dept. of Food Engineering; and Technion Israel Inst. of Tech., Haifa. Dept. of Biotechnology.
H. Kott, and L. Fishelson.
Israel Journal of Technology, Vol 12, No 5/6, p 290-297, 1974. 5 fig, 3 tab, 19 ref.

Descriptors: *Chlorination, Solar radiation, *Viruses, *Irrigation, *Effluents, Waste water(Pollution), Pollutant identification, Oxidation lagoons, Ponds, Water pollution effects.
Identifiers: *Oxidation pond effluents, Phosphate buffered saline, Poliovirus 1 LSC.

Laboratory experiments were conducted on the irrigation of tomatoes and parsley by oxidation pond effluents. In the laboratory, tomatoes and parsley were dipped in chlorinated and non-chlorinated oxidation pond effluents (OPE) and in Phosphate Buffered Saline (PBS) containing attenuated poliovirus 1 LSC. The samples were then exposed to changing climactic conditions and virus counts were taken at set intervals. Solar radiation had a significant effect on the viruses. A minimum of 0.35 cal/sq cm min was needed to effect the rate of inactivation of the virus on the vegetable surface. Exposure to sunlight and to chlorination has a large effect on the amount of virus found on the vegetables, and the combined effect was even greater. Vegetables contaminated by virus in PBS solution were also affected greatly by solar radiation. Samples kept in the dark as a test still showed virus present after 6 days, whereas no active virus were found on the vegetables after being outside and exposed to two radiation peaks in 28 h. PARTICIPATION OF MICROORGANISMS IN SULFUR TURNOVER IN POMIARETZKOE LAKE, (IN RUSSIAN),
Akademiya Nauk SSSS, Moscow. Institut Mikrobiologii.
V. M. Gorlenko, E. N. Chebotarev, and V. I. Kachalkin.
Mikrobiologiya. 43(5): 908-914. Illus. 1974.

Descriptors: *Lakes, *Microorganisms, *Sulfur bacteria, Sulfur, Meromixis, *Turnovers, Plankton, Entrophication.
Identifiers: Chlorobium-Vibrioforme, *Pomiaretzkoe Lakes, Thionic bacteria, USSR, Phototrophic bacteria.

The role of microorganisms in production and oxidation of S was studied in the meromictic lake Pomiaretzkoe (USSR) occupying the place of a former ozokerite mine. Water in the surface layers of the lake is fresh, while deep water contains up to 10 g/l of chlorides, 4.1 g/l of C02 and 340 mg/l of H2S. The highest rate of H2S production (30 mg/l/day) was registered in the upper layer of ozone deposits. The rate of H2S reduction in water was lower, but still almost 10 times higher than in water of other lakes of similar type. A high rate of sulfate reduction was due to a sufficient content in water and in oozes of sulfates, organic substances, phyto- and bacterioplankton, and organic substances of ozokerite origin. H2S in the lake was oxidized by the phototrophic sulfur bacterium Chlorobium vibrioforme, the plankton variant, and to a lesser extent, the thionic bacteria. A layer of green water, containing up to 46.106 cells of C. vibrioforme in 1 ml of water, was found at the depth of 3.0-3.5m. The maximal production of the phototrophic bacteria in this zone was 90 micro C/l/day.--Copyright 1975, Biological Abstracts, Inc.

SOME FACTORS INFLUENCING BYSSUS THREAD PRODUCTION IN MYTILUS EDULIS (MOLLUSCA: BIVALVES) LINNAEUS, 1758,
University of Southern California, Los Angeles. Allan Hancock Foundation.
T. Martella.
Water, Air and Soil Pollution, Vol 3, p 171-177, 1974. 2 fig, 1 tab, 7 ref.

Descriptors: *Biorhythms, *Mussels, *Animal physiology, Populations, Productivity, Growth rates, Tidal effects.
Identifiers: *Byssal thread production, Mytilus edulis, Circadian rhythms, Proximity.

Byssus thread production factors in Mytilus edulis considered were proximity to other M. edulis, circadian rhythms, and tidal rhythms. Production was greater at night than during the day, and greater for mussels clumped together. Tidal fluctuations had no influence on byssal thread production. The use of the average number of byssus threads produced/animal/hour as a measure of sublethal effects of pollutants may be subject to error. (Klein)

EFFECTS OF LEAD AND HYDROCARBONS FROM SNOWMOBILE EXHAUST ON BROOK TROUT (SALVELINUS FONTINALIS),
New Hampshire Univ., Durham. Dept. of Zoology.
E. S. Adams.
Transactions of the American Fisheries Society, No 2, 1975. 7 fig, 5 tab, 39 ref.

Descriptors: *Salmonids, *Brook trout, *Oil, *Organic compounds, *Lead, Ponds, Snowmelt, Path of pollutants, Water pollution effects, Environmental effects, Water quality.
Identifiers: Snowmobiles, *Snowmobile exhaust, Fingerlings, Tissue analysis, Bioaccumulation.

Lead content of the water in a Maine pond rose from 4.1ppb before snowmobiling to 135 ppb at ice-out; exposed brook trout (Salvelinus fontinalis) fingerlings contained 9 to 16 times more lead than controls. Hydrocarbon levels undetectable prior to snowmobiling reached 10ppm in the water and 1 ppm in exposed fish. Trout held in aquaria for 3 weeks in melted snow containing three different concentrations of snowmobile exhaust also showed lead and hydrocarbon uptake. Their digestive tract tissue contained the most lead (2ppm) and gills the least (0.2ppm). Stamina, as measured by the ability to swim against current, was significantly less in trout exposed to snowmobile exhaust than in control fish. (Klein)

R. C. Hoehn, J. R. Stauffer, M. T. Masnik, and C. H. Hocutt.
Environmental Letters, Vol 7, No 4, p 345-352, 1974.

Descriptors: *Oil spills, Streams, *Oil pollution, *Biological communities, *Sediments, Aquatic animals, *Benthos, Environmental effects, Water pollution sources, Water pollution effects, Toxicants, Toxicity, Virginia.
Identifiers: Species diversification, *Sediment oil analysis.

A study was conducted to assess the effects of an oil spill on the macroinvertebrate populations in a small creek in Virginia. Sediments were extracted with hexane, and the residue concentrations were correlated with the numbers and diversities of macroinvertebrates collected downstream of the spill. Based on the available data, it was concluded that the effect of the oil spill was a toxic one rather than one of rendering the sediments unsuitable for colonization. (Katz)

STATUS OF UPTAKE OF MERCURY BY THE FRESH WATER DIATOM, SYNEDRA ULNA,
Institute of Public Health, Tokyo (Japan).
M. Fujita, and K. Hashizume.
Water Research, Vol 9, No 10, p 889-894, October 1975. 6 fig, 4 tab, 10 ref.

Descriptors: *Diatoms, *Heavy metals, *Mercury, Aquatic microorganisms, Microbiology, Path of pollutants, Metabolism, Plant physiology, Phytoplankton, Plankton, Food chains.
Identifiers: *Synedra ulna, Bioaccumulation, Tissue analysis.

Synedra, a fresh water diatom, took up mercuric chloride rapidly from the surrounding water into the cells attaining the maximum level during the first 7h. The comparison of mercury uptake by dividing cells was that of non-dividing, heat killed cells and their silicate shells showed that some factors other than cell-division or photosynthesis were responsible for mercury uptake by Synedra cells. About 20% of the total amount of mercury found in dividing cells was taken up by passive adsorption and could be eliminated by washing with distilled water or medium. About 50% of the mercury could not be eluted even with cysteine solution and was accumulated in the inner part of cells. Syndera took up 0.45 micro-m filterable or ionic mercury rather than particulate mercury larger than 0.45 micro-m. (Klein)

Nansei Regional Fisheries Research Lab., Maruishi (Japan).
H. Ishioka, O. Fukuhara, and S. Sakaguchi.
Bulletin of the Nansei Regional Fisheries Research Laboratory, No 7, p 31-42, August 1974. 7 fig, 5 tab, 7 ref.

Descriptors: *Crustaceans, *Animal physiology, *Organic compounds, Survival, Growth rates, Laboratory tests, Water pollution effects.
Identifiers: *Kuruma prawns, Penaeus japonicus, *Anesthesia, *Eugenol, Bioaccumulation.

Kuruma prawn (Penaeus japonicus) juveniles were found to be anesthetized between 50-200 ppm concentrations of Eugenol. Higher concentrations and water temperature shortened anesthetizing time. Most prawns recovered from the anesthesia within one hour except at low water temperatures. Starvation, molting and low chlorinity of the medium affected the anesthetizing time. Physiological conditions increasing water content of the prawns seemed to shorten the anesthetizing time. The Eugenol treatment appeared to have no serious affect on the growth and survival of the juvenile prawns. (Klein)

arine Biology, Vol 31, No 4, p 305-310, 1975. 2 , 1 tab, 20 ref.

escriptors: *Organic compounds, hytoplankton, *Growth rates, *Oil wastes, ater pollution sources, Analytical techniques, ater pollution effects.
entifiers: *Bioaccumulation, *Benzene, oluene, Xylene, Amphidinium carterae, Du-liella tertiolecta, Skeletonema costatum, icosphaera carterae.

Experiments on 4 different phytoplankton exposed to a range of concentrations in culture of benzene, toluene and xylene showed a variety of growth responses for marine microalgae. Stimulation of growth in Dunaliella tertiolecta resulted from low microgram per liter concentrations of all three compounds, Skeletonema costatum showed no growth enhancement, while Cricosphaera carterae and Amphidinium carterae were intermediate in their reactions. The species-specific stimulation of low concentrations was further shown in experiments with mixtures of No 2, fuel oil. The volatile fraction was most biologically reactive, being the source of growth enhancement at low levels and a major growth inhibitor at high concentrations. (Klein)

FACTORS AFFECTING THE ACCUMULATION AND REMOVAL OF MERCURY FROM TISSUES OF THE AMERICAN OYSTER CRASSOSTREA VIRGINICA,
Delaware Univ., Newark. Dept. of Biological Sciences.
P. A. Cunningham, and M. R. Tripp.
Marine Biology, Vol 31, No 4, p 311-319, 1975. 3 fig, 5 tab, 29 ref.

Descriptors: *Oysters, *Heavy metals, *Mercury, Path of pollutants, Animal physiology, Analytical techniques, Water pollution sources, Temperature, Water pollution effects.
Identifiers: *America oysters, *Bioaccumulation, *Tissue analysis.

Adult oysters, Crassostrea virginica, were held in seawater containing 10 to 100 parts per billion mercury. After 45 days mercury tissue concentration was 91,600 and 12,100 ppb in the 100 and 10 ppb mercury groups, respectively. The biological half-life of mercuric acetate was 16.8 and 9.3 days in a 25 degree temperature regime, and 35.4 and 19.9 days in a declining (25 to 5 degrees) temperature regime. Smaller oysters (0-7 grams) consistently accumulated more mercury per gram wet weight than larger oysters. (Klein)

TOTAL MERCURY IN SOME FISH AND SHELLFISH ALONG THE MEXICAN COAST,
Pennsylvania State Univ., University Park.
A. A. Reimer, and R. D. Reimer.
Bulletin of Environmental Contamination and Toxicology, Vol 14, No 1, p 105-111, July 1975. 4 tab, 15 ref.

Descriptors: *Heavy metals, *Toxicity, Path of pollutants, *Shrimp, *Mollusks, *Fish, *Mercury, Water quality, Environmental effects, Fish physiology, Mullets, *Mexico, Water pollution effects.
Identifiers: *Bioaccumulation, Grey mullet, Mugil cephalus, Anisotremus interruptus, Diapterus, Codakia orbicularis, Tissue analysis, Penaeus, Muscle, Liver, Andara, Crassostrea virginica.

The mercury content found in muscle and liver of three species of fish-grey mullet Mugil cephalus, Anisotremus interruptus, and Diapterus from several Mexican localities ranged from 0.01-0.38 micrograms/gram in the muscle and 0.01-0.47 micrograms/gram in the liver. In all species investigated the mercury content of the liver was higher, sometimes more than double, that of the muscle. Value of mercury is shrimp (Penaeus) ranged from 0.01-0.67 micrograms/gram. Mercury contents in mollusks were low, except in the tiger lucine, Codakia orbicularis. (Klein)

INFLUENCE OF NAC1, CA2+, AND MG2+ ON THE GROWTH OF A MARINE BDELLOVIBRIO SP.,
Otago Univ. Dunedin (New Zealand). Dept. of Microbiology.
R. G. Bell, and D. J. Latham.
Estuarine and Coastal Marine Science, Vol 3, No 3, p 381-384, July 1975. 1 tab, 7 ref.

Descriptors: *Sewage, *Ions, *Salts, *Bacteria, Microorganisms, Sewage bacteria, Sodium chloride, Magnesium, Calcium cultures, E. Coli, Growth rates, Speciation, Water pollution effects.
Identifiers: *Marine bdellovibrio, Bacteriology.

A marine bdellovibrio was isolated from sewage-polluted coastal water, with Escherichia coli K12 as host organism, using a polyethylene bag humidor incubation technique. The isolate was able to grow only on sea water or 1.5%-5% NaCl-based yeast-peptone medium. Growth of the isolate was strongly stimulated by the addition of 0.002 M-Ca2+/and 0.002 M-Mg2+/to the NaCl-based medium. It was concluded that the isolate was halophilic and thus should be considered as distinct from, but related to, terrestrial strains. (Klein)

STUDIES ON THE EFFECTS OF TEMPERATURE ON EGG LAYING OF THREE SPECIES OF CALANOID COPEPODS IN THE LABORATORY (ACARTIA TONSA, TEMORA LONGICORNIS, PSEUDOCALANUS ELONGATUS),
Dalhousi Univ., Halifax (Nova Scotia). Dept. of Biology.
C. J. Corkett, and E. J. Zillioux.
Bulletin of the Plankton Society of Japan, Vol 21, No 2, p 77-85, April 1975. 1 fig, 2 tab, 22 ref.

Descriptors: *Copepods, *Temperature, Growth stages, Life cycles, Fertility, Populations, Growth rates, Fecundity, *Thermal pollution, Water pollution effects.
Identifiers: *Acartia tonsa, *Temora longicornis, *Pseudocalanus elongatus, Egg production.

A study of egg production in artificial sea salt over a range of temperature showed that the rate of egg production in the sac-carrying copepod Pseudocalanus elongatus was lower than that found in Acartia tonsa and Temora longicornis, which lay single eggs. It was suggested that carrying eggs attached to the females in sacs may limit the maximum egg production rate (maximum fecundity) since a new sac cannot be laid until the old one hatches. (Klein)

DRASTIC REDUCTION OF THE WHITE PERCH, MORONE AMERICANA, POPULATION IN THE JAMES RIVER, VIRGINIA,
Virginia Inst. of Marine Science, Gloucester Point.
R. A. St. Pierre, and W. J. Hoagman.
Chesapeake Science, Vol 16, No 3, p 192-197, September 1975, 2 fig, 3 tab, 15 ref.

Descriptors: *White perch, *Populations, *Fishkill, Trawling, Commercial fishing, Water quality, *Virginia, Water pollution effects.
Identifiers: *James River(Va).

The white perch population in the James River declined to near extinction by the summer of 1971. Only several individuals were captured after extensive trawling and beach seining in 1972 and 1973, whereas similar effort yielded thousands in previous years. The commercial catch simultaneously dropped to an all-time low. The cause of the population plummet apparently was a massive fish kill in May of 1971. The precise cause of the fish kill was not determined. (Klein)

MARINE MEIOFAUNA OF A NEW YORK CITY BEACH WITH PARTICULAR REFERENCE TO TARDIGRADA,
City Coll., New York. Dept. of Biology.
E. A. Martinez.
Estuarine and Coastal Marine Science, Vol 3, No 3, p 337-248, July 1975. 5 fig, 3 tab, 56 ref.

Descriptors: Beaches, *Microorganisms, *Nematodes, Sediments, Sampling, Water quality, Effluents, Sewage, Population, New York.
Identifiers: *Marine Meiofauna, *Tardigrades, Batillipes mirus, Batillipes pennaki, *New York Ctiy beaches.

Distribution and abundance of meiofauna of a New York City beach were studied. Environmental variables included particle size distribution, temperature, salinity, and interstitial water content. The substratum consisted of quartz. Both temperature and salinity were greatly influenced by adjacent offshore sea water. Nematodes were the dominant taxon, averaging 85.5% of the total collection. Tardigrades represented 6%, including Batillipes mirus and B. pennaki. (Klein)

A POSSIBLE REACTION OF ATLANTIC SALMON (SALMO SALAR) TO INJECTED CHLORAMPHENICOL,
Michigan Dept. of Natural Resources, Lansing. Fisheries Div.
V. E. Bennett.
The Progressive Fish-Culturist, Vol 37, No 2, p 114, April 1975.

Descriptors: *Salmonids, *Atlantic salmon, *Fish physiology, *Organic compounds, Spawning, Bacteria, Toxicity, Fish diseases, Michigan, Water pollution effects.
Identifiers: *Chloramphenicol, Bioaccumulation, Boyne River(Mich).

Atlantic salmon (Salmo salar) returning to Michigan's Boyne River appeared to be undergoing physiological stress. Transfer of fish to a more suitable environment was initiated. The injection of transferred fish with chloramphenicol was attempted to reduce the mortality due to bacterial infections. Mortalities occurred and fish were peppered with reddish-colored nodules resembling allergic hives. (Klein)

STUDIES ON DEATH OF FISH CAUSED BY RED TIDE, (IN JAPANESE),
Shimonoseki Univ. of Fisheries (Japan).
T. Matsusato, and H. Kobayashi.
Bulletin of the Nansei Regional Fisheries Research Laboratory, No 7, p 43-68, August 1974; 22 fig, 2 tab, 30 ref.

Descriptors: Fish, *Fish physiology, *Respiration, *Red tide, *Plankton, *Fish toxins, Oxygen requirements, Fish behavior, Mortality, Water pollution effects, Fishkill.
Identifiers: Red Sea Bream, Chrysophrys major, Yellow trail, Asphyxiation, Seriola quinqueradiata, Hemieutreptia antiqua.

The influences of the red tide on the red sea bream, Chrysophrys major, and the cultured yellow tail, Seriola quinqueradiata, were investigated in their use of the marine plankton, Hemieutreptia antiqua. Breathing rate, heart pulsation rate, and other physiological effects were investigated in both species. Oxygen levels and fish behavior were recorded. The cause of death of the fish attributed to the red tide was based on asphyxiation due to interception of the ventilation water in the branchia. (Klein)
W76-01934

EXCESS NITROGEN GAS IN WATER NOT A CAUSE OF COAGULATED YOLK DISEASE IN CHINOOK SALMON,
Bureau of Sport Fisheries and Wildlife, Seattle, Wash. Western Fish Disease Lab.
R. R. Rucker.
The Progressive Fish-Culturist, Vol 37, No 2, p 101-102, April 1975. 1 fig, 1 tab, 2 ref.

Descriptors: *Chinook salmon, *Salmonids, *Nitrogen, *Dissolved oxygen, Growth stages, Fish eggs, Fry, Fish physiology, Fish diseases, Toxicity, Water pollution effects.
Identifiers: Bioaccumulation.

No evidence of white spot or coagulated yolk disease from the exposure of excess nitrogen in water to chinook salmon (Oncorhynchus tshawytscha) eggs and fry was observed. Fingerlings showed peduncle deformities possibly resulting from oxygen deficiency during egg stage. (Klein)

EFFECTS OF AGRICULTURAL LIMESTONE ON WATER CHEMISTRY, PHYTOPLANKTON PRODUCTIVITY, AND FISH PRODUCTION IN SOFT WATER PONDS,
Auburn Univ., Ala. Dept. of Fisheries and Allied Aquacultures.
R. G. Arce, and C. E. Boyd.
Transactions of the American Fisheries Society, No 2, p 308-312, 1975, 2 fig, 4 tab, 16 ref.

Descriptors: *Tilapia, *Primary productivity, *Limestone, Fish, Ponds, Water quality, Fertilizers, *Phytoplankton, Water pollution sources, Nitrates, Phosphates, Hydrogen ion concentration, Water chemistry, Hardness(Water), Food chains, Water pollution effects.
Identifiers: Tilapia aurea, Fish culture.

Five ponds treated with agricultural limestone and five control ponds were stocked with Tilapia aurea and fertilized every two weeks with ammonium nitrate and triple superphosphate. Initially, total hardness and total alkalinity of the waters in the 10 ponds averaged 7.8 and 13.7 mg/liter, respectively. Liming caused a fourfold increase in total hardness and total alkalinity. Limed ponds had higher rates of phytoplankton productivity and yielded a 25% greater weight of fish than control ponds. (Klein)

ZOOPLANKTON ENTRAINMENT AT THREE MID-ATLANTIC POWER PLANTS,
Henningson, Durham and Richardson Inc., Santa Barbara, Calif. Ecosciences Div.
R. M. Davies, and L. D. Jensen.
Journal Water Pollution Control Federation, Vol 47, No 8, p 2130-2142, August 1975, 9 fig, 2 tab, 14 ref.

Descriptors: *Zooplankton, *Power plants, *Water quality, Survival, Water cooling, Temperature, Chlorine, Sampling, Thermal pollution, Water pollution effects.
Identifiers: *Entrained zooplankton, Thermal tolerance.

The change in mortality of zooplankton resulting from entrainment into cooling water systems depended on the interaction of ambient temperature, temperature rise, mechanical stress, and chlorine levels when applied. Analysis of zooplankton survival to quantity delayed mortality or impaired reproductive potential was found necessary to ascertain the fate of entrained plankton which might have been otherwise hidden by dilution in the mixing zone of the discharge canal. Population changes between the intake the discharge, and receiving water were studied for estimation of survival of entrained zooplankton. (Klein)

THE DYNAMICS OF METALS IN THE AMERICAN OYSTER, CRASSOSTREA VIRGINICA SEASONAL EFFECTS,
Johns Hopkins Univ., Baltimore, Md. School Hygiene and Public Health.
J. M. Frazier.
Chesapeake Science, Vol 16, No 3, p 162-171, September 1975. 4 fig, 4 tab, 33 ref

Descriptors: *Oysters, *Mollusks, *Animal physiology, *Metals, Metabolism, Path of pollutants, Cadmium, Manganese, Zinc, Copper, Growth rates, Water pollution effects.
Identifiers: *American oysters.

Different patterns of metal dynamics were observed as a result of the reduction in biological variation realized by employing genetically similar American oysters, Crassostrea virginica. Mn and Fe concentrations in soft tissues were significantly correlated with shell deposition. A high rate of metal turnover in soft tissues occurred during the short growth season. Zn and Cu body burdens exhibited a gradual increase during the spring and summer followed by a rapid loss during August-September in which 33% of the Zn and 50% of the Cu was lost in 4 weeks. Cd behavior was similar to that of Mn and Zn. (Klein)

THE INFLUENCE OF EMBANKMENTS ON THE PRIMARY PRODUCTION OF PHYTOPLANKTON IN THE ARCHIPELAGO OF FOGLO, ALAND,
Abo Akademi, Turku (Finland). Inst. of Biology.
J. Westerberg.
In: Proceedings of the 3rd Baltic Symposium on Marine Biology, No 239, p 78-82, 1975. 2 fig, 4 ref

Descriptors: *Embankments, *Primary productivity, *Phytoplankton, *Channels, Environmental effects, Water quality, Benthic flora, Currents(Water).
Identifiers: *Finland(Archipelago of Foglo).

The primary production of phytoplankton was measured in situ by the 14C method at three localities with embankments. The stations were all situated in long channels, where water currents are more important ecological factor than wave action. The embankments create stagnant conditions, or considerably decrease the flow of water. At some of the stations the macrophytes formed a carpet on the bottom in shallow water, and phytoplanktonic primary production seemed to be inversely related to the density of the bottom vegetation. However, there were indications that the total production of aquatic plants increased in places where embankments influenced the flow of water. (Klein)

OVE GROUND PRODUCTION AND CHEMI-
L ANALYSIS OF PHRAGMITES COMMUNIS
POLLUTED BRACKISH WATER,
ckholm Univ. (Sweden). Botany Inst.
-G. Wallentinus.
Proceedings of the 3rd Baltic Symposium on
rine Biology, Helsinki, No 239, p 109-115, 1975.
g, 1 tab, 7 ref.

scriptors: Technology, *Submerged plants,
trogen, Phosphorus, Biomass, Analytical
hniques, Chemical analysis, Water quality,
gnant water, Sodium, Potassium, Magnesium,
lcium, Brackish water.
entifiers: *Phragmites communis, *Reeds culms.

e two aims of this investigation were to develop
simple method for the determination of the
ove ground biomass of reed-beds and to in-
stigate the distribution of certain ions in the read
lm, Phragmites communis. The culms were har-
sted down to and including the upper parts of
e rhizomes. The culms were dried and the stems
ere cut into 10-cm sections and weighed. From
ese weights formulas were constructed, where
e total weight of the culm aove the water sur-
ce, the weight of the stem at the water surface,
nd the water depths were inputs, giving the
eight of the entire culm. Diving was thus neces-
ary only for collecting the material for estimating
e formula constants. The dried material was then
round, wet combusted and analyzed for N,P and
ertain cations. The maximum concentrations of N
nd P were found in the physiologically active
arts, whereas the cations showed a more
eterogeneous distribution. (Klein)

EFFECTS OF A SULPHATE PULP MILL ON THE BENTHIC MACROFAUNA IN A FIRTH OF THE BOTHNIAN SEA,
Swedish Water and Air Pollution Research Lab., Goteborg.
R. Rosenberg, K. Nilsson, and L. Lander.
In: Proceedings of the 3rd Baltic Symposium on Marine Biology, Helsinki, No 239, p 289-300, 1975. 7 fig, 2 tab, 14 ref.

Descriptors: *Marine animals, *Pulp wastes, *Benthic fauna, Industrial wastes, Sulfates, Water pollution sources, Sewage, Animal physiology, Toxicity, Crustaceans, Path of Pollutants, Bivalves, Water pollution effects.
Identifiers: *Benthic macrofauna, *Pulp mills, Pontoporeia affinis, Macoma baltica, Mesidothea entoman, Shell growth, Kraft pulping wastes, *Bothnian Sea.

Natrafjarden, a firth in the Bothnian Sea, receives a yearly discharge of organic wastes from a sulphate pulp mill equivalent to about 8000 tons BOD7. The firth is covered with ice for about 4 months of every year and the salinity below a depth of 10m is 5-6% parts per thousand. The organic wastes were transported in the surface water and oxygen depletion was not observed during the investigation period 1969-1972. The benthic macrofauna was sampled at 32 stations (depth 5-57 m), 12 of which were azoic, comprising an area of about 1 km2. Four communities were distinguished with respect to depth and pollution. The most frequently found species were Pontoporeia affinis and Macoma baltica and Mesidothea entomon, of which the two latter were most tolerant of pollution. Shell growth of Macoma and recruitment of Pontoporeia were reduced in polluted areas. Comparisons were made with the fauna of other polluted areas. (Klein)

CHANGES IN PLANKTON RESULTING FROM EUTROPHICATION OF A BALTIC FIRTH,
Gdansk Univ. (Poland). Inst. of Oceanography.
K. Wikor, and M. Plinski.
In: Proceedings of the 3rd Baltic Symposium on Marine Biology, Helsinki, No 239, p 311-315, 1975. 4 fig, 7 ref.

Descriptors: *Primary productivity, *Eutrophication, *Phosphates, Water pollution effects, Wastes, Systematics, Polulation, Water quality, *Plankton.
Identifiers: *Baltic Sea.

Research on plankton was carried out in 1955-1972 in the Szczecin Firth. Phosphate concentration increased 5-20 times the level in 1955, probably due to industrial and agricultural pollution. Pollution also caused increased plankton production as well as changing the plankton diversity composition. (Klein)
W76-01948

THE EFFECTS OF FERRY TRAFFIC ON ROCKY SHORE VEGETATION IN THE SOUTHERN ALAND ARCHIPELAGO,
Abo Akademi, Turku (Finland). Inst. of Biology.
O. Ronnberg.
In: Proceedings of the 3rd Baltic Symposium on Marine Biology, Helsinki, No 239, p 325-330, 1975. 3 fig, 1 tab, 9 ref.

Descriptors: *Transportation, *Algae, *Littoral, Benthos, Sampling, Biomass, Waves(Water), Population, Methodology, Navigation, Water pollution effects.
Identifiers: *Ferry traffic, Water action, *Littoral zones, Macroalgae, Verrucaria maura, Fucus cesiculosus, *Finland(Aland Archipelago).

The vertical extent of littoral and sublittoral macroalgae along 10 test lines with different degrees of exposure was investigated by means of skin diving. Along the lines directly exposed to the fairway hydrolittoral filamentous algae were found at depths between 0.3 and 1.8 m, while the normal depth for such algae was 0.2-0.6m. The biomass on lines directly exposed to the fairway was 30% less in the hydrolittoral zone and 50% less in the sublittoral zone than on lines sheltered from the ferries' wash. The force of the wash on the shore was measured with spring dynamometers at different distances from the fairway. (Klein)
W76-01949

THE EFFECTS OF FERRY TRAFFIC ON THE ROCKY SHORE MACROFAUNA IN THE SOUTHERN ALAND ARCHIPELAGO: I. THE CLADOPHORA ZONE,
Abo Akademi, Turku (Finland). Inst. of Biology.
H. -R. Fagerholm.
In: Proceedings of the 3rd Baltic Symposium on Marine Biology, Helsinki, No 239, p 331-337, 1975. 6 fig, 1 tab, 10 ref.

Descriptors: *Sampling, *Marine animals, *Biomass, Methodology, Navigation, Transportation, Waves(Water), Sampling, Population, *Cladophora.
Identifiers: Ferry traffic, Water action, Finland(Aland Archipelago), *Baltic Sea.

Quantitative macrofauna samples were taken in the Cladophora zone, using an acrylic plastic frame (400cm2). The sampling localities were situated in the northern Baltic at different distances from the navigation route used by ferries passing regularly through narrow straits in the Finnish and Swedish archipelagoes. Two localities were investigated monthly for one year. The composition of the macrofauna is given. The mean biomasses were 1.4 grams/meter2(fresh wt) in the locality close to the fairway and 19.1 grams/meter2in the controlled locality. The corresponding individual numbers were 806/meter2 and 7271/meter2. A simple dynamometer was used to measure the dynamic pressure in the swell acting upon the shores at different distances from the fairway. (Klein)
W76-01950

ALGAL ZONATION ON ROCKY SHORES OUTSIDE HELSINKI AS A BASIS FOR POLLUTION MONITORING,
Helsinki City Engineer's Office (Finland). Water Conservation Lab.
L. Lindgren.
In: Proceedings of the 3rd Baltic Symposium on Marine Biology, Helsinki, No 239, p 344-347, 1975. 1 fig.

Descriptors: *Water pollution sources, *Eutrophication, *Algae, Primary productivity, Water quality, Domestic wastes, Speciation, Bioindicators, *Monitoring, Sampling, Water pollution effects.
Identifiers: *Baltic Sea, *Helsinki(Finland), *Algal zonation, Pollution gradients, Sphacelaria artica, Eurcellaria fastigiata.

The three typical vegetation belts of the Baltic (green, brown, and red algal belts) could not be distinguished in the most polluted (entrophied) district, the inner archipelago of Helsinki. Elsewhere, slight deviations from the normal species composition of the Baltic were observed. The ecology and relative abundance of the individual species also differed from those in clean areas of the Baltic. (klein)

5D. Waste Treatment Processes

A BARGAINING APPROACH FOR PROGRAMMING LEAST-COST WASTE TREATMENT ALONG A RIVER,
North Carolina State Univ., Raleigh. Dept. of Economics; and North Carolina State Univ., Raleigh. Dept. of Business.
D. Airan, J. A. Seagraves, and D. S. Airan.
Available from the National Technical Information Service, Springfield, Va 22161 as PB247-108. $4.50 in paper copy, $2.25 in microfiche. University of North Carolina Water Resources Research Institute UNC-WRRI Report No 109, August 1975, 62 p, 5 fig, 8 tab, 18 ref, 3 append. OWRT B-054-NC(4). 14-31-0001-3952.

Descriptors: *Cost allocation, *Waste water treatment, *Costs, Standards, *Optimization, Model studies, Permits, *Cost comparisons, *North Carolina.
Identifiers: *Neuse River(NC), Waste discharges, *Discharge permits, Discharge charges, Least costs, Optimum solutions, *Treatment levels.

A model is developed for minimizing waste treatment costs to achieve a given stream standard. An optimum set of treatment levels is calculated using available information about the cost of waste treatment and the effects of waste in different reaches with an assumed procedure for bargaining among waste dischargers. Each discharger is assumed to be responsible for the quality of water in his reach. The optimum solution suggests an optimum set of discharge permits and charges, However, it does not favor any one administrative system or distribution of costs. The model is run to find optimum or least-cost waste treatment levels for the Neuse River of North Carolina. The optimum solution has much less treatment than is currently being used. The costs of present waste treatment are estimated to be $3.7 million per year while the cost of the optimum set of treatment levels is only $1.09 million. (Stewart-North Carolina)
W76-01504

SOLUBILIZATION AND WET OXIDATION OF SUSPENDED AND DISSOLVED ORGANICS,
Delaware Univ., Newark. Dept. of Chemical Engineering.
J. R. Katzer.
Available from the National Technical Information Service Springfield, Va 22161 as PB247-106, $5.50 in paper copy, $2.25 in microfiche. Delaware Water Resources Center, Newark, Completion Report, September 1975. 97 p, 30 fig, 16 tab, 21 ref. OWRT A-027-DEL(1).

Descriptors: *Oxidation, Chemical reactions, Kinetics, Chemical degradation, Sludge disposal, Design, Evaluation, Ultimate disposal, *Waste water treatment, Economics, Sludge, *Organic wastes, Solubility.
Identifiers: Glucose, *Wet oxidation, Process design, Solubilization.

The aqueous-phase solubilization of yeast and the aqueous-phase oxidation of glucose were studied in an autoclave between 150 and 230 C and 0 to 470 psia 02 pressure. The rate of yeast solubilization was first order in solids concentration and involved both rapid oxidation and slower hydrolysis reactions. The aqueous-phase oxidation of glucose was first-order in glucose consumption and in total organic carbon (TOC) removal. Glucose consumption occurs by a thermal (hydrolytic or dehydrative) decomposition and an oxidative mechanism. The activation energy for both glucose oxidation and TOC removal and for yeast solubilization was about 17 kcal per mole. The cost for wet oxidation of sewage sludge was about the same as that for a wet and catalytic oxidation process. However, wet oxidation achieved only 70% COD reduction, whereas wer and catalytic oxidation produced 99% TOC removal.

APPARATUS AND METHOD FOR PRODUCING AIR BUBBLES IN A BODY OF LIQUID.
Canadian Patent 974,671. Issued September 16, 1975. Patent Office Record, Vol 103, No 37, p 37-72, September, 1975.

Descriptors: *Water pollution control, *Patents, *Bubbles, Equipment, Oil spills.
Identifiers: Surface water pollutants.

An apparatus and method for producing air bubbles in a body of liquid have been patented. The effectiveness of air barriers in restraining surface water pollutants is achieved by equalizing the air pressure in a perforated bubbling hose. An auxiliary distributing conductor carrying high pressured air and interconnected at intervals with the bubbling hose is utilized. (Waltner-FIRL)
W76-01535

RECOVERY SYSTEM FOR OXYGEN FROM WASTE WATER OXYGENATION.
Chicago Bridge and Iron Company, Oak Brook, Ill. (assignee).
K. W. Lange, and J. B. Maher.
United States Patent 3,909,409. Issued September 30, 1975. Official Gazette of the United States Patent Office, Vol 938, No 5, p 2396, September, 1975. 1 fig.

Descriptors: *Waste water treatment, *Patents, *Oxygen, Biochemical oxygen demand, Gases, Carbon dioxide, Recycling.
Identifiers: Oxygen recovery.

A system for the recovery of oxygen from the oxygenation of waste water has been issued a patent. Substantially pure gaseous oxygen is introduced through waste water with a high biochemical oxygen demand (BOD). An effluent stream of g containing oxygen mixed with nitrogen, carb dioxide, water vapor, and other gases present trace quantities is separated from the oxygenat waste water. The effluent stream of gas is fed in a pool of liquid oxygen. This solidifies the carb dioxide and converts the water vapor to ice. A g stream containing oxygen, nitrogen, and tra quantities of other gases is separated from t liquid oxygen. The gas stream is then cooled to temperature sufficiently low to condense only t oxygen in the nitrogen. The condensed a liquified oxygen is separated from the nitrog gas, and returned to the pool of liquid oxyge Liquid oxygen is vaporized from the pool and us to treat additional waste water. (Orr-FIRL)

SEWAGE TREATMENT SYSTEM INCLUDIN EFFLUENT EVAPORATOR,
Coate Burial Vault, Inc., West Milton, Oh (assignee)
K. J. Yost.
United States Patent 3,907,679. Issued Septemb 23, 1975. Official Gazette of the United Stat Patent Office, Vol 938, No 4, p 1837, Septemb 1975. 1 fig.

Descriptors: *Patents, *Sewage treatment, *Wa water treatment, Tanks, Equipment, Conduits, E fluents, *Evaporators.

A patented sewage treatment system is describ which includes a tank buried within the grou This tank has an inlet to receive sewage water a an outlet to discharge a clear water effluent. A evaporation device is provided to evaporate the fluent into the atmosphere. The evaporation equi ment consists of an elongated flexible tubular co duit system of plastic material, which is arrang to form a substantially flat horizontal coil buri within the ground. This conduit system has an in end portion connected to the outlet of the ta which receives the effluent, an outlet end portio and means to vent the outlet end portion to the mosphere above the ground. This is accomplish by means of an air supply tube connected to conduit system along several longitudinally spac intervals of the conduit system. Thus, several streams are produced into the conduit syste producing a longitudinal flow of air in a comm direction within the upper portion of the condu system for discharge as vapor to the atmosphe through the conduit system outlet. THE APPLICATION OF INCLINED TUBES PLATES TO SEDIMENTATION TANKS WASTEWATER TREATMENT.
Water Pollution Research Lab., Stevena (England).
Notes on Water Pollution, No 68, March, 1975 p, 19 ref.

Descriptors: *Separation techniques, *Sewa treatment, *Waste water treatme *Sedimentation rates, Installation, Economi Tertiary treatment, Activated sludge, Biologi treatment, Flow rates, Treatment facilities, Des criteria, Overflow.
Identifiers: *Sedimentation tanks, Inclined tub Solids removal, Overloading.

The use of inclined tubes or plates in existi horizontal flow sedimentation tanks in order to crease the flow rate for solids removal has been vestigated. These have been considered sewage treatment facilities when the capacity the facility has been exceeded by population creases, and extra sedimentation tanks have been constructed to absorb the overloadi Inclined plates were originally produced comm cially for the separation of oil and water and still used for this purpose. While the installation inclined tubes in existing horizontal-flow sedim tation tanks has been successfully done,

dure is recommended only if the temperature influent is not significantly higher (by more ne degree C) than the bulk liquid tempera- nd if the module can be washed down once few weeks or provision is made for in situ ng to prevent growth of algae. From experi-, it was found that sloping tubes or plates are le for uprating overloaded humus tanks, but t applicable for final settlement tanks in the ted sludge process. They are not suitable for y treatment without the use of a flocculant. h tubes or plates are to be used, the sedimen- tank should be designed on the basis of ow rate using the total plan area of the . While the cost of installing sloping tubes is han the construction of a new tank, the c tube module will last no longer than ten . Thus this procedure is suggested only where rary overloading is the problem where a new will be built during the following ten years, en there is a severe limitation on availability d space. MI PUSHES REGIONALIZATION TO P PACE WITH POPULATION,
i-Dade Water and Sewer Authority, Fla.
itsema.
r and Wastes Engineering, Vol 12, No 9, p 24- eptember, 1975. 2 fig, 3 tab.

riptors: *Waste water treatment, *Treatment ties, Waste water disposal, Sludge treatment, ge disposal, Florida, Sewerage, Infiltration, onal development, Activated sludge, Landfill. ifiers: Miami(Fla).

Miami-Dade Water and Sewer Authority has expanding and regionalizing to keep up with apidly growing population of the area. The ram is under the auspices of the Water Quality agement Plan (WQMP) for Dade County, da. The plan includes the expansion of the inia Key plant from 47 to 110 mgd, the con- tion of an 80 mgd plant, and a 50 mgd plant. A th regional waste water treatment plant (85) will be constructed in 1985. The Virginia Key t is being expanded by the addition of aeration s, final settling tanks, and a 55 mgd pure ox- activated sludge process without primary set- . Sludge will be processed by anaerobic stion, heat treatment, dewatering, and use as a builder and landfill. The 80 mgd plant will use gen activated sludge. Some of the sewage that be processed at this plant will be brackish due alt water infiltration in the sewer lines. The age high in chlorides will be kept separate from sewage low in chlorides, and the treatment t units will be operated separately as saline or -saline. Sludge from this plant will be treated at Virginia Key facility. The 50 mgd plant will use ngle stage oxygen activated process, sludge kening, anaerobic digestion, heat treatment, atering, and sludge cake for soil building. te water disposal from the plants will be ocean all, injection wells, or reuse as cooling water. -FIRL)

NITARY LANDFILLS: NO PLACE FOR ACHING,
hards of Rockford, Ill.
oeppner.
ter and Wastes Enginering, Vol 12, No 9, p 47- 53, September, 1975. 7 fig.

scriptors: *Waste water Treatment, *Leachate, ndfills, Water pollution control, Biological tment, Waste water disposal, Irrigation, Waste posal, Groundwater, Costs, Treatment facili- , Plastic pipes, Aerated lagoons.
ntifiers: *Zero discharge.

o discharge of leachate from the inactive Jeff- Sanitary Landfill in Jefferson County, Missou- has been accomplished by a process which in- cludes collection, secondary biological treatment, and land disposal. The leachate system comprises a leachate collection and conveyance system; and aerated faculative lagoon component; a pumping station,; a force main; a surface ridge and furrow land irrigation system; and, a system of monitoring wells. Plastic pipe, installed two feet below the surface of the clay stratum, is used to collect leachate being generated along its entire length by gravity. An impervious plastic liner has also been inserted along the downhill sidewall and bottom of the construction trench. The aerated lagoon operates on the extended aeration principle utilizing a long detention time and a low ratio of organic loading. The expected overall removal of BOD is 85%. The secondarily treated effluent from the lagoon is discharged, using the ridge and furrow irrigation method, to a wooded ridge. An adjacent downslope eight-acre wooded area provides an additional infiltration area to prevent runoff from reaching a stream. Monitoring wells have been installed to determine the efficacy of the leachate collection and irrigation system, and to detect any detrimental effects on groundwater quality. The treatment facilities, pump station, and irrigation system are automatically operated. Total costs for acquisition, construction, and installation of the project were around $49,000. (Orr-FIRL)

LOWER SPEED AERATORS CUT ENERGY USE,
Bird Machine Co., South Walpole, Mass. Wastewater Treatment Equipment.
Water and Wastes Engineering, Vol 12, No 9, p 76-77, 79-80, September, 1975. 6 fig.

Descriptors: *Waste water treatment, *Aeration, Equipment, *Energy, Costs, Economics, Activated sludge, Capital costs, Impellers.
Identifiers: *Aerators.

Very low speed (VLS) aerators for waste water treatment processes can lower the costs of energy while increasing the oxygen transfer efficiency. Oxygen transfer efficiency in surface aerators at a given power level has been improved by innovative impeller design, larger impellers and lower speeds. However, aerators of this type have a higher capital costs than high speed aerators. Low speed surface aerators are the best choice for activated sludge systems. New concepts of tip speed and pumpong can be used to optimize the surface aerator design. Tip speed is only the tangential component of the mixed liquor discharge. Radial and vertical components must be added to the tip speed to determine the absolute discharge velocity from the blade. After design tip speed is chosen, the RPM and impeller size necessary to achieve the speed can be determined. It is advantageous to choose a large impeller diameter because of its higher pumping capacity. Mixing theory requires about five turnovers of a homogeneous fluid for complete mixing within the aeration zone. VLS surface aerators can achieve turnover in 6-10 min, for the same power, and increase actual oxygen transfer efficiency. The larger gear reducer and impeller required for VLS surface aerators increases the capital cost. However, the annual power cost savings effected by VLS aerators can offset the increased capital cost well within the usual industrial amortization time of three to five years. (Orr-FIRL)

WE MUST IMPROVE CHLORINATION DESIGN,
MCA Engineering Corp., Baltimore, Md.
C. M. Robson, B. S. Hyatt, Jr., and S. K. Banerji.
Water and Wastes Engineering, Vol 12, No 9, p 61-66, 68, September, 1975.

Descriptors: *Waste water treatment, *Disinfection, *Chlorination, Chlorine, Mixing, Analytical techniques, Measuring, Equipment, Design.

More stringent standards for the disinfection of waste water necessitates the improvement of chlorination practices. Recent standards concerned with virus inactivation call for free residual chlorine levels after one hour of 0.5 mg/liter to 3.0 mg/liter. The most commonly used method of measuring residual chlorine is the orthotolidine method. The amperometric titration method, based on an oxidation reduction procedure, is becoming more commonly used for waste water. Factors affecting the efficiency of the disinfection process include the quality of the influent to the disinfection process, temperature, pH, turbidity, and the presence of materials which exert a chlorine demand. The most important parameters in chlorination are rapid initial mixing, adequate contact time, and a workable automatic chlorine residual control system. Mixing in a chlorine system must be rapid; the ideal mixing time is a fraction of a second. An equation to predict the efficiency of chlorine disinfection is discussed, and a means of statistically analyzing the data from dye testing of contact chambers is illustrated. The most significant factor in the configuration of a chlorine contact chamber has been analyzed to be the length-to-width ratio. Current research on the effects of chlorine residuals on the aquatic environment has demonstrated the need for dechlorination. Sulfur dioxide, sodium bisulfite, sodium sulfite, sodium metabisulfite, and granular activated carbon can be used for dechlorination. (Orr-FIRL)

FUNDAMENTALS OF ELIMINATING ORGANIC WATER POLLUTANTS WITH POLYETHYLENE (GRUNDLAGEN DER ELIMINIERUNG ORGANISCHER WASSERBELASTUNGSSTOFFE MIT POLYAETHYLEN),
L. Weil, and G. Greiner.
Vom Wasser, Vol 43, p 247-257, 1974. 2 fig, 5 tab, 10ref.

Descriptors: *Organic compounds, *Flocculation, *Oil, *Waste water treatment, *Polymers, Polyelectrolytes, Potable water, Adsorption, Laboratory tests.

Waste water samples containing organic pollutants were treated on a laboratory scale to produce potable water in a flocculation plant with an hourly throughput of 400 cu m. Similar treatment was given to slightly polluted groundwater and bank-filtered river water for comparison. Polymer substances were added to the organic compounds before flocculation; these polymers were an emulsifier-free dispersion of a copolymer of ethylene and vinyl acylamide. Because the disperse plastic had a particle size of only 0.5 micrometers, short contact times were possible. Results indicated that lipophilic organic compounds (such as chlorinated insecticides, petroleum spirit, and crude oil) were removed far more efficiently from the waste water with polyethylene powder than with conventional chemical treatment methods. The addition of the polymer can be implemented in existing treatment facilities without adding further processing stages. Possibilities of applications and economics of the method are discussed. (Kramer-FIRL)
W76-01555

MOTIONLESS MIXERS IMPROVE OXYGEN TRANSFER EFFICIENCIES, PART I,
Kansas State Univ., Manhattan. Dept. of Chemical Engineering.
K. H. Hsu, L. E. Erickson, and L. Fan.
Water and Sewage Works, Vol 122, No. 8, p 76-79, August, 1975. 6 fig.

Descriptors: *Chemical oxygen demand, *Activated sludge, *Biological treatment, *Waste water treatment, *Mixing, Equipment, Microorganisms.
Identifiers: *Oxygen transfer, Motionless mixers, Koch mixer.

Effects of various types of motionless mixers on oxygen transfer efficiencies are discussed. A multistage cocurrent sieve tray tower system and a cocurrent column packed with Koch mixers were studied. The multi-stage tower type activated sludge process was more efficient than any other known activated sludge process. A bubble column and a six-stage perforated plate column were applied to activated sludge treatment. Sludge in the bubble column caused bulking while sludge from the six-stage perforated plate column had good settling properties. The Koch mixer column removed COD as efficiently as the sieve tray column. Both mixers experienced wall growth by the organisms. (Pinto-FIRL)
W76-01556

UPGRADING HIGHWAY SERVICE AREA WASTEWATER TREATMENT PLANTS,
I. P. Sander.
Public Works, Vol 106, No 10, p 70-72, October, 1975. 1 fig.

Descriptors: *Waste water treatment, *Water supply, *Treatment facilities, *Sewage treatment, Flow rates, Clarification, Chlorine, Standards, Highways, New York.
Identifiers: Highway service, facilities.

Waste water treatment plants and center supply sources operated at highway service areas by the new York State Thruway Authority are discussed. Of 28 service facilities now in use, 27 are served by 24 Authority-owned waste water treatment plants. In 1964, with the aid of a counsulting firm, the water and waste water facilities were surveyed and recommendations for modifications were made. During the past ten years, five primary waste water treatment plants were converted to secondary treatment and others have been enlarged and improved. The Malden area about two hours from Metropolitan New York has encountered an unanticipated increase in peak daily flow. While the 1964 survey predicted a peak flow of 47,000 gpd, by 1972 the flow rate for 24 hours was 86,000 gallons. The plant was therefore redesigned, placing an aerated holding tank in the flow scheme following communition. This allowed a constant flow to be maintained in the primary clarifier so that the unit could function most effieiently. A plastic media packed bed reactor was later added and results were very satisfactory. Treatment plants along the Thruway are generally manned by a single operator, and chlorine handling was made relatively safer by the use of small chlorine containers of about 40 pounds. The summer partonage of the service areas is higher than in the winter and the chlorine containers must be changed more frequently. For each waste water treatment facility, the Authority has National Pollution Discharge Elimination Permits (NPDES) and the update or upgrading of the facilities will be conducted in order to comply with discharge standards. NITRATE REMOVAL BY ANION-EXCHANGE RESINS,
Environmental Protection Agency, Cincinnati, Ohio. Water Supply Research Lab.
R. W. Buelow, J. W. Kropp, J. Winthered, and J. M. Symons.
Journal of the American Water Works Association, Vol 67, No 9, p 528-534, September, 1975. 3 fig, 9 tab, 11 ref.

Descriptors: *Nitrates, *Anion exchange, *Ion exchange, Potable water, *Waste water treatment, Pollutant identification, Economic feasibility, Resins, Selectivity, Chemical analysis, Water pollution treatment, Chemical precipitation, Water treatment, Groundwater, Iron, Sulfates, Coasts.
Identifiers: *Nitrate selective resin, Nitrate removal.

High concentrations of nitrate in drinking water obtained from groundwater can cause serious illness or death. An ion exchange process has been developed using a nitrate selective resin which can remove low concentrations of nitrate. A laboratory study was conducted: to test the selectivity ot the resin; to test the performance of the resin when there are high concentrations of nitrate and other anions; to determine the influence of specific ions on resin performance; and to determine the economic feasibility of the process. Other ions used in the study were bicarbonate, silica, chloride, sulfate and iron. In small concentrations the resin shows a preference towards exchange of nitrate over sulphate and other ions, but at higher concentrations, the resin shows a preference for sulfate. In both hard and soft well water, nitrogen removal by the resin was decreased to 25.5% of base capacity. Iron precipitated and caused a fouling problem in the exchange. In studying the influence of specific ions on nitrate removal, it was found that silica reduced nitrate removal to 67.5% of base capacity, sulfate reduced it to 40 to 43.6%, sulfate plus alkalinity reduced it to 33.3%, and sulfate plus alkalinity plus chloride reduced it to 28.2%. Regeneration of the resin in the water was made possible by the addition of sodium chloride. This process becomes more feasible around a coastal area where there is an abundance of salt water. The cost of nitrate removal varies considerably with the quality of water, based mainly on the salt requirement. (Pinto-FIRL)

CONTRACTOR TEAMS TOUCH ALL BASES BUILDING WATER-SIDE SEWAGE FACILITY,
McGraw-Hill World News, San Francisco, Calif.
M. R. Drossel.
Construction Methods and Equipment, Vol 57, No 9, p 40-43, September, 1975.

Descriptors: Construction materials, Treatment facilities, Construction costs, Grouting, Oxygenation, Sludge digestion, Waste water treatment, California.
Identifiers: Oakland(Calif), Laser alignment, Hydraulic hoist, Scaffolding.

Work on the Oakland, California, East Bay Municipal District sewage treatment plant is discussed. The project cost $56 million. Cost saving aspects included concrete conveying and gang-forming for a dozen settling tanks, compartmentalized oxygenation tanks and four sludge digester tanks; tank-riding, self-propelled scaffolds; an outfall pipe submerging and placing system featuring a hydraulic hoist, laser alignment and force-fed rock bedding; and specially grouted and doweled piling. Three settling tanks were built at a time, each one taking 16 days to complete. The four sludge tanks were built in 10 weeks. Laser alignment of a 624 ft addition to an eight foot diameter outfall piping permitted work to proceed in the fog and in the murky waters of Oakland Bay. A premixed non-metallic grout for the securing of the dowells at the tops of the piles was also used to cut installation costs. (Pinto-FIRL)

THE DEVELOPMENT OF A CENTER PIVOT WASTEWATER IRRIGATION MACHINE,
Metropolitan Sanitary District of Greater Chicago. Ill.
G. W. Hall.
Presented at 1974 Winter Meeting of the Americ Society of Agricultural Engineers. December 1 13, 1974. Chicago, Illinois. 5 fig, 2 tab, 7 ref.

Descriptors: *Sprinkler irrigation, *Waste wat disposal, Application methods, Application equi ment, *Irrigation practices, Irrigation water, rigation, Irrigation systems.
Identifiers: *Center pivot irrigation machine.

The center pivot irrigation industry continues improve its product each year. Problem are highlighted by a testing program were correct and incorporated into the manufacturers mo changes for the next year. Probably the most i portant difference between a conventional cen pivot irrigation machine and a wastewater cen pivot irrigation machine is the spray bar conce The low operating pressure requirement provid a lower operating cost because of lower pump costs. However, the high instantaneous appli tion rate of the spray bar concept limits its appli tion to areas where the soil has a high intake rat surface runoff is minimized. The center pi wastewater irrigation machine will continue to b modified conventional center pivot irrigat machine until the wastewater market developes the point where the center pivot industry begins conduct research and development programs. T goal of the wastewater industry and the agric tural industry is the same and that is to hav economical, dependable irrigation machi (Skogerboe-Colorado State)

A LOW COST WASTE TREATMENT METH FOR THE DISPOSAL OF DISTILLERY WAS (SPENT WASH),
Walchand Coll. of Engineering, Sangli (India).
B. S. Rao.
Water Research, Vol 6, No 11, p 1275-1282, 19 4 fig, 3 tab, 9 ref.

Descriptors: *Industrial wastes, *Waste wa treatment, *Sewage lagoons, *Waste wa disposal, Pilot plants, Biochemical oxygen mand, Chemical oxygen demand, Organic load Fertilizers, Asia, Hydrogen ion concentration, rigation, Potassium, Costs.
Identifiers: *Distillery wastes, Volatile sol India.

Experimental studies in India indicate that di lery wastes can be treated in open anaer lagoons. An organic loading of 0.604 kg BOI m/day is optimum for a BOD removal efficie of 90-95% and volatile solids reduction of 7 When anaerobic lagoon treatment is followe another lagoon, BOD can be reduced to 600 n COD was 1.38 times the total volatile solids centration for raw spent wash and 1.54 times for lagoon effluent. Lagoons can operate volatile acid accumulation of 21,000 mg/l above pH 6.5 the efficiency is lowered. Su concentrations of 5000 mg/l did not affect formance. Effluents contained 300-500 sulfate/l. Anaerobic lagoon effluent diluted with fresh water was used to irrigate sugar c the deleterious effects of about 5000 kg pot um/ha accumulation in the soil in one year are nown. No deleterious effects were observe the soil, crop, pH, conductivity, and ca exchange. Lagoon depth can vary between 0.9 m, but a 1.8 depth showed better performa The largest distillery in India is now treating entire spent wash (800,000 l/day) in lagoons. COD and BOD of the effluent from the last la is 5000 an 1800 mg/l, respectively. (Bucha Davidson--Wisconsin)

nd, Chemical oxygen demand, Biological
nent, Color, Suspended solids, Colloids,
e treatment, Reverse osmosis, Operating
, Chemical precipitation, Filtration, Nutrient
val, Irradiation, Activated sludge, Oxidation
ns, Recycling, Pilot plants.
ifiers: *Textile dye removal.

r management and waste disposal problems
e textile industry are reviewed. There is no
e, economical treatment method. Biological
nent is the most economical, provides good
emical oxygen demand removal, but does not
ve enough color, chemical oxygen demand,
nded solids, and nutrients to be used alone.
th of filamentous organisms cause poor set-
ility. Use of reverse osmosis or adsorptive
s for dissolved organic and color removal
be preceded by chemical flocculation, sedi-
ation, or filtration, otherwise they are im-
ical. Success of carbon adsorption depends
es used and colloidal nature of the liquid to
ltered; chemical pretreatment or sedimenta-
may be required. Hyperfiltration of effluents
omising if cost can be competitive. Gamma
tion to degrade refractory dye colors plus
entration of the organic fraction with an ad-
nt prior to irradiation are possible. The most
tical approach includes reducing water use;
ng relatively clean water; economic study of
nical recycling; development of recycleable
nicals; replacement of toxic dye substances;
of biodegradable compounds; and study of
s directed toward elimination of non-
egradable colors. Today biological treatment
e best choice, possibly in combination with
nical coagulation. (Buchanan-Davidson--
nconsin)

URVEY OF WASTEWATER TREATMENT
HNIQUES FOR STEEL MILL EFFLUENTS,
S Corp., Pittsburgh, Pa. Cyrus Wm. Rice Div.
Centi.
'The Steel Industry and the Environment,'
ceedings of the 2nd Furnas Memorial Con-
nce, p 169-198, 1973. 5 fig.

criptors: *Metalurgy, *Steel, *Effluents,
aste water treatment, Mills, Water utilization,
, Suspended solids, Surveys, Oil wastes,
ds, Liquid wastes, Chemical wastes, Metals,
irculated water, Gases, Air pollution.
ntifiers: Coke.

ter pollution problems in the steel industry in-
ve size of operation, large water volumes,
ety of products, and age of the industry. About
0,000 gallons water are used per ton finished
l. Manufacturing process techniques used by
t of the industry are described, divided into
e manufacturing (beehive coke making,
roduct coke manufacture); iron manufacturing
sh furnace, cupola); steel manufacturing (basic
gen furnace, open hearth, electric furnace,
tinuous casting, vacuum degassing); hot form-
(blooming, slabbing, bar, hot strip, structural,
et, plate, seamless pipe, rod, and buttweld pipe
ls); and cold finishing (batch pickling; continu-
pickling; cold rolling; electric weld pipe, screw
nut, and nail mills; cold drawing; tin plating;
coating and galvanizing). Waste water charac-
stics from each are discussed, effluent parame-
ters described, and methods of handling effluents discussed. Principal wastes are suspended solids, oils, acids, soluble metals, and coke plant materials. Treatment methods and efficiency vary with source, volume, and combination of wastes. Some companies provide a well-defined single treatment scheme for total plant effluents. Recirculating and reuse techniques deserve more attention. Waste treatment methods must be carefully planned and monitored. (Buchanan-Davidson--Wisconsin)

SCIENTIFIC SYMPOSIUM ON DAIRY EFFLUENT TREATMENT,
J. S. Cooper, and L. Royal.
The Milk Industry (U.K.), p 25-27, October 1973.

Descriptors: *Conferences, *Dairy industry, *Waste water treatment, Pollution abatement, Byproducts, Analytical techniques, Chemical oxygen demand, Bacteria, Pathogenic bacteria, Water reuse, Trickling filters, Chemical precipitation, Biological treatment, Europe, Sprinkler irrigation, Oxidation lagoons, Biochemical oxygen demand, Economics.
Identifiers: *Denmark, Product recovery.

A symposium organized by the Danish Government Research Institute for the Dairy Industry under the auspices of the Danish Natioanl Committee of the International Dairy Federation was held in 1973. Delegates from many countries presented papers discussing aspects of dairy effluents such as control of waste materials, sampling, analysis, public health, and chemical and biological treatment methods. The conclusions were that an International Dairy Federation group on the subject of dairy effluent treatment should be formed to study control of losses, waste prevention methods, water reuse, sampling, analytical methods, treatment plant economics, sludge disposal, and spray irrigation. Waste prevention and surveys of effluent sources received less attention than treatment processes. Extended aeration plants in the form of oxidation ditches are used on the European continent. Germany had studied high rate filtration with plastic media before use of oxidation ditches. Except for Holland, standards for discharges to water courses were less severe than the United Kingdom Royal Commission Standards and involved only a biochemical oxygen demand requirement which demanded less capital expenditure and operational control. Sludge disposal was given little attention. (Buchanan-Davidson--Wisconsin)

THE TREATMENT OF BLAST FURNACE GAS WASHING EFFLUENT,
British Steel Corp., Wolverhampton (England). Bilston Works.
R. T. Myatt, R. J. Aston, and K. S. Johnson.
Iron and Steel International, Vol 46, No 5, p 421-424, 1973. 3 fig, 3 tab.

Descriptors: *Steel, *Cooling water, *Waste water treatment, *Industrial wastes, Treatment facilities, Design, Pilot plants, Costs, Standards, Carbonates, Dissolved solids, Zinc, Hydrogen ion concentration, Lime, Activated sludge, Chlorine, Oil wastes, Toxins, Phenols, Ammonia, Biochemical oxygen demand.
Identifiers: *Blast furnace cooling towers, *British Steel Corp.(England), Cyanide.

The Bilston Works of Special Steels Division, British Steel Corporation, converted the blast furnace gas washing effluent system to a recirculating system, with sufficient bleed-off to prevent excessive build-up of dissolved solids and problems arising from carbonate scale deposit in pumps, pipework, and cooling tower. Optimum bleed-off volume was about 10,000 gallons/hour. At this rate, the dissolved solids content was 1500-2000 ppm with no marked increase in cyanide and zinc. Pilot plant tests in which pH control with lime was followed by an activated sludge process resulted in variations in cyanide and zinc concentrations over short periods. Chlorine oxidation under alkaline conditions of effluents containing cyanides appeared feasible. Plans for the treatment plant had two phases: first, removal of oil, cyanides, and toxic metals and adjustment of pH by physicochemical treatment; and secondly, removal of phenols, ammonia, and reduction of biochemical oxygen demand by biological oxidation techniques to limits set by the Trent River Authority. The first stage has been operational for one year. The average reagent cost per million gallons effluent was 82.30 British pounds. The second stage plant is being designed to use first stage effluents as feed liquors to produce discharges that meet water quality standards. The plant is described. (Buchanan-Davidson--Wisconsin)

TERTIARY TREATMENT OF PROCESS WATER,
American Oil Co., Whiting, Ind.
A. E. Franzen, V. G. Skogan, and J. F. Grutsch.
Chemical Engineering Progress, Vol 68, No 8, p 65-72, 1972. 7 fig, 9 tab, 5 ref.

Descriptors: *Tertiary treatment, *Waste water treatment, Industrial wastes, Indiana, Oil wastes, Chemical wastes, Coagulation, Flotation, Nutrient removal, Design, Hydrogen ion concentration, Pilot plants.
Identifiers: American Oil Co., Whiting(Ind), Alum.

The waste water stream from the American Oil Company refinery at Whiting, Indiana, required extensive treatment before discharge into Lake Michigan. Three stages of treatment are now in effect. The final step, tertiary treatment by chemical coagulation and air flotation, has been in operation more than a year and is an effective method for removal of contaminants. A second stage treatment called Bio-Flotation, incorporates a series of bio-flotation ponds where biological oxidation, sedimentation, and flotation of biological solids and contaminants occur. Chemical treatment with alum and polyelectrolytes is used to coagulate residual contaminants. Phase separation was accomplished by air flotation. The effluent has a better appearance and phosphates are removed in the final step. Air flotation causes further improvements in biochemical oxygen demand, total oxygen demand, threshold odor number, pH, turbidity, phenolics, oil, and suspended solids. The driest scum is probably produced when skimmers are operated at a speed no greater than that required to keep up with scum production. The design parameters for the air flotation system and performance of the tertiary treatment facilities are given. (Buchanan-Davidson--Wisconsin)
W76-01634

RECOVERY OF MATERIALS FROM THE WASTEWATER FROM WINE DISTILLERIES BY DRYING THE MIXTURE OF SOLID AND LIQUID WASTES,
Water Supplies of Languedoc-Roussilon (France). Regional Board of Management.
G. Ducellier.
Water Research, Vol 7, No 4, p 595-598, 1973. 9 fig, 1 tab.

Descriptors: *Waste water treatment, *Industrial wastes, *Drying, *Byproducts, Solid wastes, Liquid wastes, Europe, Fertilizers, Feeds, Nutrients.
Identifiers: *Wine distilleries, *Wine dregs.

Undiluted wine distillery waste has a biochemical oxygen demand above 100,000. Until recently effluents of wine dregs distillation were discharged into lagoons or water. Spent wine is more difficult to purify than domestic sewage. After chemical and biological treatment, diluted spent wine still has a BOD of 600-3000. During biological treat-

ment, degradation rates vary according to size and complexity of the molecules. Purification frequently decelerates with high loads consequently waste water must be diluted by recycling purified effluent. Reclaiming fertilizer or cattle feed from wine dregs may be more economical than treatment. When mould and distilled dregs were dried in an oven and the open air or completely dried in the open air, the product could be stored for one year and used as sheep feed. The least costly method was to prepare fertilizer by pre-drying in the open air to 65% water content then oven drying to 50% water content. Nitrogen, phosphorus, and potassium were not changed by drying. The dried mixture contained an average of 3.3% nitrogen, 1% phosphorus, and 1.5% potassium. (Buchanan-Davidson--Wisconsin)

SOME EFFECTS OF METALS DISCHARGED IN EFFLUENTS AND POSSIBILITIES FOR THEIR RECOVERY,
Water Pollution Research Lab. Stevenage (England).
J. D. Swanwick, and J. V. O'Gorman.
Chemistry and Industry (G.B.), p 537-540, June 16, 1973. 29 ref.

Descriptors: *Metals, *Sewage, *Reclamation, Effluents, Europe, Zinc, Copper, Nickel, Chromium, Sewage disposal, Chemical precipitation, Anaerobic digestion, Industrial wastes, Sewage sludge, Cadmium, Lead, Toxicity, Electrophoresis, Electrodes, Heavy metals, Recycling, Ion exchange, Reverse osmosis, Activated carbon, Adsorption, Polyelectrolytes.
Identifiers: England.

Metals may be removed from sewage as hydroxides, basic carbonates, or sulfides, depending on metal ion concentration and pH. More zinc, copper, and nickel were removed in activated-sludge than primary sludge. Nitrified effluents removed more copper, nickel, zinc, or chromium. Anaerobic sludge digestion increased the values of industrial and domestic sludge contents of copper, nickel, zinc, chromium, cadmium, and lead. The relative toxicities of nickel, copper, and zinc to plants were 8:2:1, and digested sludge could be safely applied to crops but metals in dewatered sludge cake approached dangerous levels. Heavy metals inhibited anaerobic digestion, but sodium sulfide or cadmium acetate eliminated the inhibition. A silver:silver electrode can be used to monitor soluble sulfides and detect heavy metals built up in sludge. Metals can be recovered by recycling metals and water or by precipitation from effluents and recovering from sludge. Metals can be concentrated by incinerating sludge or treating effluents with lime. Hydrometallurgical recovery processes are more flexible, economical, and cause less pollution than thermal processes. Metals can be recovered from sludge by dissolving in acid, and separating by integrated treatment systems, solvent extraction, ion exchange, reverse osmosis, electrochemical methods, activated carbon adsorption, or formation of complexes with polyelectrolytes. WASTE TREATMENT FOR THE PABST BREWERY AT PERRY, GEORGIA,
Wiedeman and Singleton, Atlanta, Ga.
T. R. McWhorter, and R. J. Zielinski.
In: Proceedings 26th Industrial Waste Conference, Part 2, Extension Series No. 140, p 604-612, 1971. 2 fig, 5 tab.

Descriptors: *Treatment facilities, *Design, *Waste treatment, *Industrial wastes, *Georgia, Fluctuations, Biochemical oxygen demand, Suspended solids, Sludge disposal, Sprinkler irrigation, Effluents, Automation, Flow rates, Chemical oxygen demand.
Identifiers: *Breweries, Pabst Brewery, Perry(Ga), Big Indian Creek(Ga).

Big Indian Creek, an unpolluted stream high in dissolved oxygen and low in biochemical oxygen demand, solids, hardness, and coliforms, was the receiving stream for treated brewery effluent. Major sources of waste were spent grain press liquor, decant from filter decant tanks, yeast remaining after yeast recovery, spillage, cleaning rinses, and caustic cleaning solution dumps. Variations in flow volume, biochemical oxygen demand, dissolved solids, pH, and temperature were large. The plant was designed to treat 7500 bbl waste/day. Waste was collected in seven systems as uncontaminated cooling water, cooling tower blow down, sanitary sewage, diatomite filter backwash, spent caustic cleaning solution, high strength process waste, and other process wastes. The anticipated waste loads and limited stream assimilation capacity required removal of 97% biochemical oxygen demand and 95% suspended solids. The treatment process was multi-stage with coarse screen, grit chamber, primary clarifiers, plastic media trickling filters, activated sludge basins, final clarifiers, effluent polishing lagoon, aerobic sludge disgestion basins, sludge lagoons, and sludge sprays. Raw waste flow averages one million gallons/day. Average monthly chemical oxygen demand removal is 95-97%. The biochemical oxygen demand/chemical oxygen demand ratio decreases throughout treatment. Effluent quality has been very stable. (Buchanan-Davidson--Wisconsin)

LIMESTONE TREATMENT OF RINSE WATERS FROM HYDROCHLORIC ACID PICKLING OF STEEL,
Armco Environmental Engineering, Middletown, Ohio.
J. E. Barker, S. F. Melzer, and R. D. Snook.
In: Proceedings of the 26th Industrial Waste Conference, Part 2, May 4-6, 1971, Purdue University, Lafayetts, Indiana, p 49-53.

Descriptors: *Limestone, *Acidic water, *Waste water treatment, *Steel, Iron oxides, Oxidation, Operating costs, Neutralization, Aeration, Sludge treatment, Filtration, Waste disposal, Treatment facilities, Design, Capital costs, *Ohio.
Identifiers: *Steel pickling water, Ferrous hydroxide sludge, Middleton(Ohio).

Ferrous metals develop oxide coatings during manufacture, which are removed from low carbon steels by acid pickling and rinsing with water, forming spent pickling acid and rinse water. Armco Steel Corporation's Middleton, Ohio Works could handle spent pickling acid, but not acid rinse water. An economical hydrochloric acid rinse water treatment, was developed utilizing limestone neutralization, aeration, and sludge recurculation to oxidize ferrous iron and produce filterable precipitates. Pilot studies indicated that higher temperatures resulted in higher system capacities and filtration rates. At each temperature there was a minimum pH, below which ferrous iron oxidation was incomplete. Since acid rinse water flow at the treatment plant was half that expected, retention times were approximately doubled. Increased aeration tank retention time probably accounted for success in treating waste at lower temperatures. Total effluent iron concentration was less than 5 mg/l, turbidity was low, and pH 6.8-7.1. Sludge was easily dewatered and handled. The lagoon was successfully stocked with fish. One man can handle the treatment facility. At a waste volume of 900 gpm and total acid concentration of 500 mg/l, operating costs, excluding supervision and sludge disposal were $0.24/1000 gal acid rinse water. (Buchanan-Davidson--Wisconsin)

REMOVAL OF ZINC FROM PLATING RINSE WATER BY SIMPLE NEUTRALIZATION,
Dittmann (Carl) and Co., Karlsruhe (West Germany).
M. Rodenkirchen.
Plating, p 698-700, July 1973. 1 fig, 3 ref.

Descriptors: *Waste water treatment, *Zinc, *Neutralization, Separation techniques, Ammonium compounds.
Identifiers: *Plating rinse waters, Sodium hydroxide.

A new leveling bright zinc chloride plating proces using a weak acid, high-performance zinc platin electrode was studied to determine if zinc could b separated from zinc-containing rinse water. Th procedure is economical and easy to control an maintain. Zinc removal from water rinses follow ing this procedure was studied. Rinse water zin concentration depended on cycle time, surfac area and contour of the part, zinc concentration o the plating bath, etc. High zinc concentrations in dicated that the rinsing procedure was faulty. In sufficient rinsing causes white spots on the zin surface. Rinse water samples were diluted an neutralized at pH 8.6. Ammonium ions complexe hydroxyl ions up to about 0.45 g zinc/l. In rins water containing 200 mg zinc/l maximum, zin was quantitatively precipitated. The upper pe missible limit was 450 mg zinc/l. Zinc did not for stable complexes at pH 8.6, so there was no inte ference with NaOH precipitation. The zinc co tent of the supernatant rinse water after th precipitate had settled was within legal efflue limits (3 mg/l); special treatment was not require (Buchanan-Davidson--Wisconsin)

ES FROM THE MALTING AND BREW- NDUSTRY,
Valker.
Pollution Manual, J. R. Fuller, editor. Thun- d Enterprises, Ltd., Harrow, Middlesex, nd, 1972, p 174-179. 13 tab, 10 ref.

Descriptors: *Industrial wastes, *Waste water treatment, Effluents, Organic matter, Biochemical oxygen demand, Activated sludge, Spraying, Waste water disposal.
Identifiers: *Brewing industry, *Malting industry, England.

The various processes of malting, the conversion of malt into beer, bottling, and cask washings disposal, all of which generate high BOD effluents, are discussed. Several methods of treating the effluents in small and large operations are described. One plant consists of a plastic filled biotower followed by a pair of conventional stone filled filters operating on an ADF cycle. It is handling 60,000 gpd at 2000 ppm BOD and has been shown to be capable of producing an effluent with 20 ppm suspended solids and 20 ppm BOD. There is an activated sludge system handling some 1650 lbs BOD per day, though some difficulty is encountered from filamentous growth and sludge bulking and it is necessary to supply both nitrogen and phosphorus. A full scale activated sludge plant in the form of Pasveer ditches was installed at a malting plant and is working successfully. A large scale experiment was tried where malting effluents were disposed by spraying on pasture land. Spent grains and spent hops may be removed as wet solids but in some breweries they are resuspended in water and pumped out as a slurry. Filters are usually powder or sheet types. (Auen-Wisconsin)

A FACILITY FOR THE BIOLOGICAL TREATMENT OF A COMPLEX CHLOROPHENOLIC WASTE,
Arkansas Univ. at Little Rock. Div of Life Sciences.
W. F. Evans.
Arkansas Academy of Science Proceedings, Vol 25, p 38-40, 1971. 1 fig, 7 ref. FWQA WPRD 246-01-68.

Descriptors: *Sewage treatment, *Biological treatment, *Herbicides, 2,4-D, 2,4,5-T, Industrial wastes, Arkansas, Aerated lagoons, Oxidation lagoons, Biochemical oxygen demand, Hydrogen ion concentration, Dissolved oxygen, Plankton, Coliforms, Equipment, Biodegradation.
Identifiers: *Jacksonville(Ark), Chlorophenols, Chlorophenoxy acids.

Industrial wastes entering the Jacksonville, Arkansas, sewage treatment facility contain chlorophenols and chlorophenoxy acids from the manufacture of the hormone-type herbicides, 2.4-D and 2.4.5-T. An aeration lagoon was built to aerate the total flow before release into two existing oxidation ponds. Because data collected during a preliminary survey and 12 months following completion of the aeration system had not been released, no firm conclusions on the efficiency of the system can be reached, but preliminary results indicate that the aeration lagoon removed 55 to 89% of the chlorophenols. Overall chlorophenol removal by the lagoon and stabilization ponds was 87 to 94%. Chlorophenoxy acid removal was 30 to 70% in the lagoon and 49 to 80% in the lagoon and oxidation ponds. During plant operation the average biochemical oxygen demand was 15 mg/l, chlorophenols 0.1 mg/l, and chlorophenoxy acids 1.1 mg/l. There was no significant change in pH, dissolved oxygen, or type and number of plankton one year after operation of the plant began. Reduction in the number of coliforms was good in the stabilization pond effluents; counts were high in the summer, low in winter, and intermediate in spring and fall. (Buchanan-Davidson--Wisconsin)

STUDIES ON ELECTROLYTIC TREATMENT OF WASTE WATER (I): REGENERATION OF PHOTOGRAPHIC BLEACH SOLUTION, (IN JAPANESE),
E. Torikai, H. Maeda, and Y. Kawami.
Osaka Kogyo Gijutsu Shikenjo Kiho, Vol 26, No 1, p 1-9, March, 1975. 10 fig, 3 tab, 6 ref.

Descriptors: *Waste water treatment, *Industrial wastes, *Chemical wastes, Electrolysis, Recycling.
Identifiers: Photographic processing wastes, Potentiostatic electrolysis, Ferricyanide bleach regeneration.

The regeneration of photographic ferricyanide bleaches using potentiostatic electrolysis was studied. The optimum conditions for the electrolysis include: an anodic potential of 0.5 to 0.7 V vs. SCE; a platinum coated titanium of graphite anode; a graphite or titanium cathode; a bleach solution anolyte; a catholyte of NaOH, KOH, NaBr, KBr in a one mol/liter solution; a ceramic or organic polymer membrane diaphragm; and, a temperature between 20 and 40 C. The current efficiency of the method was 98.5 to 99.8 percent. The sub-reaction of Br(-) to Br was controlled in the potentiostatic method which prevented the undesirable precipitation of Fe(OH)3. In the potential range of 0.5 to 0.7 V, the oxidation reaction of Fe(CN)6(4-) to Fe(CN)6(3-) in the bleach solution was considered as a mass transfer limited reaction. The cell current can be used to control the variation of the Fe(CN)6(4-) concentration in the electrolyte. (Orr-FIRL)

CLEANING UP THE RHINE.
Chemical Age, Vol 111, No 2932, p 20, September 26, 1975.

Descriptors: *Waste water treatment, *Industrial wastes, *Chemical industry, Treatment facilities, Sewage, Biochemical oxygen demand, Sedimentation, Settling basins, Sludge treatment, Incineration, Sludge disposal.

The BASF Ludwigshafen plant is the largest chemicals production site in Europe, producing nearly 6000 different products including about 2.1 million ton/year of fertilizers and the same amount of plastics. In 1964, the BASF began a ten year program to solve its emission problems, and to help clean up the Rhine river. The construction of an effluent treatment plant to handle the industrial wastes and sewage from the city of Ludwigshafen and part of the nearby area of Frankenthal was a major part of the plan. The new facilities will reduce the BOD loading of the waste water streams by at least 95 percent. The wastes are first screened to remove solids greater than 0.8 in. and then sent to four primary sedimentation basins. After activated sludge treatment, the water is passed to 10 secondary sedimentation basins. The sludge is settled for one day in one of five basins and then mixed with recycled ash and ferric chloride and dried in chamber filter presses. The resultant dried mixture with a residual moisture between 50 and 55 percent is then incinerated in fluidized bed furnaces. Future plans include two or more primary sedimentation basins, 10 more secondary sedimentation basins, and four extra sludge thickening basins. (Orr-FIRL)
W76-01663

POLYVINYL CHLORIDE-BASED FILTER MATERIAL,
V. P. Sokolov.
Soviet Patent SU 424581. Issued January 23, 1975. Soviet Inventions Illustrated, Vol W, No 31, p D2, September 9, 1975.

Descriptors: *Waste water treatment, *Industrial wastes, *Chemical industry, Filtration, Plastics, Suspended solids, Polymers, *Patents.
Identifiers: *Polyvinyl chloride.

A patent has been issued for a polyvinyl chloride based filter material for waste water treatment. The efficiency of filtration of waste waters is improved by using the filter material consisting of finely dispersed PVC or its copolymer with vinyl acetate with an addition of 50-80 weight percent of $BaSO_4$ and 20-50 weight percent of the polymer or copolymer. The addition reduces the oxygen demand of the waste water by 45-50 percent and the turbidity by 20-22 times. The filtrate will contain 2-3 mg/liter of suspended and colloidal material. This method was used to treat an effluent from a PVC manufacturing process containing 640 mg/liter of suspended and colloidal polymer particles. This was filtered through a 30 mm layer containing 6 weight percent $BaSO_4$ and vinyl chloride, and 40 weight percent of acetate copolymer. The amount of the oxygen demand was reduced by 45 percent, the turbidity by 20 times, and the solid and colloidal particles to 3 mg/liter. (Orr-FIRL)

PLANNING WASTEWATER TREATMENT BY EXPANDABLE PARAMETER-WITHDRAWAL TECHNOLOGY,
Firestone Tire and Rubber Co., Akron, Ohio.
F. G. Troppe.
Pollution Engineering, Vol 7, No 9, p 65-66, September, 1975. 2 fig.

Descriptors: *Waste water treatment, *Industrial wastes, *Chemical industry, Planning.

An engineering analysis using an expandable parameter-withdrawal technology will help to optimize the cost/benefit/safety requirements of industrial water pollution control and abatement programs. A basic parameter-withdrawal model was employed at a synthetic rubber plant in Akron, Ohio. Each of the primary treatment techniques of waste blending and flow stabilization, bar screening for trash removal, chemical coagulation/flotation for suspended solids removal, pH adjustment, and oil removal were depicted as a series of building blocks performing only the minimum parameter-withdrawal necessary for discharge of the effluent to a municipal treatment plant. The model was utilized at another synthetic rubber plant which required more extensive treatment because the discharged effluent goes directly to a high-quality stream. More consideration must be given to total recycle of a plant's waste water in order for treatment to remain economically competitive. This building block approach is valuable to the pollution engineer in the preliminary planning of new facilities. The approach allows the quick identification and inclusion of major cost items. ROTARY DRUM VACUUM FILTRATION FOR CHEMICAL/BIOLOGICAL SLUDGE,
Lubrizol Corp., Deer Park, Tex.
C. W. Brabston.
Filtration Engineering, Vol 6, No 4, p 12-13, 16, May/June, 1975. 2 fig.

Descriptors: *Waste water treatment, *Industrial wastes, *Chemical industry, Filtration, Sludge treatment, Biological treatment, Dewatering, Lime.
Identifiers: *Rotary drum vacuum filtration.

The waste water from the Lubrizo Corporation's plant in Deer Park, Texas, which produces chemical additives for petroleum products, is treated in a one million gpd treatment plant. Treatment consists of oil separation, equalization, neutralization, aerated lagoon treatment, and final sedimentation. The chemical and biological sludges are thickened prior to combining them for dewatering by rotary drum vacuum filtration. Vacuum filtration was chosen after a series of field tests were performed. The filters selected were eight-foot in diameter by 10 ft length, 250 sq ft Ametek units equipped with 30 hp vacuum pumps. Initial problems with the filter cloth selected were corrected when a polyester cloth (70 x 120 threads per inch) was chosen. Experimentation was performed with various combinations of feeds to find the best combinations for the production of a maximum cake yield at a minimum expense. The best combination was found to be approximately five to eight percent solids for the chemical sludge, and three to five percent solids for the biological sludge. The sludges are combined at a three to one, chemical to biological ratio, conditioned with 100-150 percent lime, and then filtered. The rate of feed varies between 50 and 60 gal/min. The final cake is about 28-35 percent solids. Filter cleaning is accomplished by rotating low pH water from the plant in the vacuum filters for about eight hours. A continuing research program is being conducted at the plant to determine the factors that can be varied and the modes of operations that can be run, in order to have some idea of what to do when new problems occur. OZONATION OF PHOTOGRAPHIC PROCESSING WASTES,
Eastman Kodak Co., Rochester, N.Y.
R. W. Bober, and R. J. Dagon.
Journal Water Pollution Control Federation, Vol 47, No 8, p 2114-2129, August, 1975. 11 fig, 3 tab, 14 ref.

Descriptors: *Waste water treatment, *Industrial wastes, *Chemical wastes, *Ozone, Biochemical oxygen demand, Chemical oxygen demand, Tertiary treatment, Biological treatment, Biodegradation.
Identifiers: *Photographic processing wastes.

The use of ozone to degrade certain refractory organic wastes and to reduce the BOD and COD of photographic processing wastes has been studied. Various chemicals found in processing solutions were ozonated, individually and collectively, in order to determine whether ozone could be used as a practical combined tertiary treatment after biological treatment of these wastes or whether it would be more practical to treat individual processing solutions selectively with ozone. Work performed on a small laboratory scale indicated that ozone might best be used as a preliminary treatment for overflow color developer solutions, particularly those containing phenidone and hydroxylamine sulfate; as a preliminary treatment for other solutions containing large amounts of thiocyanate, formate, EDTA, or black-and-white developing agents; and, as a tertiary treatment and disinfectant for overall mixed waste after that waste had first been treated biologically. While ozone will not oxidize all the chemicals present in photographic processing effluents, ozone following biological treatment serves to destroy certain organics that biodegrade slowly, removing color and odors. COATING RECLAIM AT CONSOLIDATED PAPERS, INC., WISCONSIN RAPIDS DIVISION,
Consolidated Paper, Inc., Wisconsin Rapids.
L. J. Welling, and W. C. Vreeland.
Tappi, Vol 58, No 9, p 105-107, September, 1975. 4 fig.

Descriptors: *Waste water treatment, *Industr wastes, *Pulp and paper industry, Recyclin Costs, Biochemical oxygen demand, Landf Wisconsin.

In March 1974, a system was started to recla and reuse blade coating at the Wisconsin Rap plant of Consolidated Papers, Incorporated. T system was designed from the results of tests r since 1970. A flow diagram of the coating wa clarifier system is presented. The blade coat reclaim system results in a conservation of r materials of about 3-4 ton/day which represen savings of nearly $150,000 on almost 1000 tons blade coating reclaimed in 1974. The solids lo ing, BOD, and quantity of landfill are grea reduced by the system. The tanks, piping, pum valves, automatic controls, and other associa equipment for the system cost about $65,000. T reclaimed coating is added to the size pr coatings. Reclaimed coating color varies but th differences are easily controlled by the compu color control system. It is now necessary to a more antifoamer to the size press coatin Spoilage of the reclaimed coating is anot problem with reuse; the reclaimed coating mus treated properly and used promptly to prev spoilage. BIOFILTRATION SYSTEM FOR FABRIC PRODUCER.
International Dyer, Textile Printer, Bleacher and Finisher, Vol 154, No 4, p 169, August 15, 1975.

Descriptors: *Waste water treatment, *Industrial wastes, *Textiles, Filtration, Plastics, Activated carbon, Color.
Identifiers: *Biofiltration, Flocor.

The original activated sludge treatment system at the Laura Ashley factory in Carno, Wales, G.B., a major producer of fashion fabrics and dresses, was unable to handle the daily flow rate of 100,000 gal, with a BOD level of 1700 mg/liter, suspended solids content of 40 mg/liter, and the presence of solvents. A plant survey and waste treatability study indicated that a combination of high-rate and low-rate biofiltration would be the most economical and effective treatment technique. In the first phase of the two-phase treatment plant, the effluent passes over two towers each packed with 278 cu m of Flocor E high-rate plastic media, and then goes to settlement tanks. The load is reduced by 50 percent and then by 75 percent. The Royal Commission Standard is obtained by final treatment of the waste water over 294 cu m of high-surface-area plastic random media, Flocor RC. Phase 2 of the treatment plant is activated carbon treatment for color removal. (Orr-FIRL)
W76-01674

HYDROCYCLONE FOR CLARIFYING WOOL-WASHING LIQUID,
B. V. Arkhipov.
Soviet Patent SU 440156. Issued February 14, 1975. Soviet Inventions Illustrated, Vol W, No 29, p D3, August 26, 1975. 1 fig.

Descriptors: *Waste water treatment, *Industrial wastes, *Textiles, *Patents, Equipment.
Identifiers: Wool-scouring liquors, *Hydrocyclone.

A hydrocyclone for clarifying wool-scouring liquid has been patented. The hydrocyclone contains a vessel with a chute for the heavy fraction, a tangentially mounted inlet nozzle, an outlet trough with an outlet nozzle, and a rotor rigidly fastened on a drive shaft. The rotor has external ribs and a conical cavity. The shaft has an axial cavity with radial channels. The improved design of the centrifugal rotor, incorporating the cylindrical and vertically ribbed external surface, will increase the efficiency of clarification of wool-scouring liquid in the initial wool processing treatment. The inner conical cavity of the rotor is connected to the axial cavity of the shaft. The conical cavity increases the area of contact between the fluid and the rotor, as well as the force which throws the heavy fraction towards the walls of the vessel. (Orr-FIRL)
W76-01675

THE TREATMENT OF TEXTILE DYEHOUSE EFFLUENT.
Effluent and Water Treatment, Vol 15, No 8, p 421, August, 1975. 1 fig.

Descriptors: *Waste water treatment, *Industrial wastes, *Textiles, Filtration, Clarification, Biological treatment, Pilot plants.
Identifiers: Biofiltration, Flocor, Acalor High Rate Biofilter Plant.

The results of a pilot plant incorporating plastic biofiltration medium to treat effluent from the textile works of John Heathcoat Limited, at Tiverton, G.B., demonstrated that the plastic biofiltration medium was capable of treating the effluent to the standards of the Devon River Authority. As a result of this conclusion, a one mgd full scale treatment plant was designed and installed at the textile works. Since the plant was to be located on the site of the existing raw water concrete and brick clarification lagoon, a new clarifier system had to be chosen. After considering a number of clarification systems, a recirculating solids contact clarifier was picked; this system includes flocculation and clarification within the same compact basin which occupies only 25 percent of the space of the original basin. The treatment facility is an Acalor High Rate Biofilter Plant with 60,000 gal capacity balancing facilities, and automatic pH control and reagent feed facilities. The biofilter tower is packed with 226 cu m of Flocor plastic filter medium. Advantages of the plant include a minimum of space required, little maintenance, and no operational problems. The plastic biofilter can also handle shock loads of BOD. (Orr-FIRL)
W76-01676

THE RECOVERY OF METALS FROM RINSE WATERS IN 'CHEMELEC' ELECTROLYTIC CELLS,
Electricity Council Research Centre, Capenhurst (England).
C. L. Lopez-Cacicedo.
Transactions of the Institute of Metal Finishing, Vol 53, Part II, p 74-77, Summer, 1975. 2 fig, 5 tab, 14 ref.

Descriptors: *Waste water treatment, *Industrial wastes, *Metals, Electrolysis, Costs, Operating costs.
Identifiers: Chemelec cells, Electrolytic cells.

Electrolytic extraction of metal from plating rinse waters is the only method capable of recovering the metal as pure metal. Chemical precipitation, solvent extraction, ion exchange of reverse osmosis will recover metal as concentrated solutions or sludges. The performance of Chemelec cells is compared with other types of electrolytic cells. Chemelec cells are a combination of mesh electrodes and non-conducting fluidized beds. Experiments were performed with copper, zinc, and nickel deposition in Chemelec cells. The Chemelec process is economical in terms of obtaining a high purity metal deposit from the metal in the rinse waters which can be reused or sold. In addition, the process effects a water savings. A plant using the Chemelec system to recover 20 ton of metal/year would cost around 10,000 pounds for cells, pumps, piping, rectifier, electrodes, and associated equipment. Operating costs would be about 75 pounds/ton of copper, if copper starting mesh is used. Titanium mesh would lower the cost to about 55 pounds/ton of copper. Conventional electrolytic cells would require a larger plant, rectifier, and other equipment than Chemelec cells. The capital costs of a plant employing conventional cells would be about 15,000 pounds and the operating costs would be about 160 pounds/ton copper. In determining the total economics, the costs that can be offset against expenditure (value of the metal recovered and water savings) must be estimated in each situation. Chemelec cells have proved economical in laboratory and pilot plant tests. This process should now be tested in a plating shop. (Orr-FIRL)

PRACTICAL GUIDE TO TREATMENT OF CHROMIUM WASTE LIQUORS,
Allied Chemical Corp., Syracuse, N.Y. Industrial Chemicals Div.
J. Kraljik.
Metal Finishing, Vol 73, No 10, p 49-55, October, 1975. 3 fig, 1 tab, 20 ref.

Descriptors: *Waste water treatment, *Industrial wastes, *Metals, *Chromium, Standards, Legislation, Sewers, Activated carbon, Chemical precipitation, Ion exchange, Evaporation, Treatment facilities.
Identifiers: Electroplating wastes.

Some of the current water pollution control legislation for the electroplating industry and some means of meeting the effluent limitations are discussed. The Environmental Protection Agency (EPA) has stated that effluent limitations should

be based on the weight of pollutant per unit of plated area rather than on ppm so that limitations will not be met by simple dilution of the waste stream. The EPA limitations for existing plants and new plants are listed. EPA has also released standards for the discharge of electroplating effluents into municipal sewers. These standards are designed to protect the operation of municipal treatment plants and to prevent the introduction of any pollutant which may not be adequately treated. Chromium plating wastes can be reduced with sodium metabisulfite, sulfur dioxide and ferrous sulfate in batch, continuous, and integrated treatment systems. Other treatment methods discussed include electrolytic reduction, direct precipitation with barium salts, activated carbon adsorption, ion exchange, evaporation, and electrodialysis. The factors involved in the choice of treatment facilities and method are also discussed. (Orr-FIRL)
W76-01678

AUTOMATIC SYSTEM PURIFIES PRE-FINISH EFFLUENT AT 45 GPM,
Ball Corp., Denver, Colo. Ball Metal Container Corp.
D. A. Davis, and R. F. Reeves.
Industrial Finishing, Vol 51, No 40, p 30-36, October, 1975. 1 fig, 5 photos.

Descriptors: *Waste water treatment, *Industrial wastes, *Metals, Sewerage, Neutralization, Oily water, Separation techniques.

The treatment plant for the new aluminum can manufacturing plant of the Ball Metal Container Group, Ball Corporation, at Williamsburg, Virgina, automatically handles all effluent generated in producing 1.5 million two-piece cans daily. The wastes are treated at the plant and then released into the James City County sewer system. The discharged wastes must be free of oils, metal ions, suspended solids, floatable materials, flammable substances, and have a pH of 6.5 to 9.0. The liquid wastes originate from the three can washing processes each consisting of six stages. Each can finishing line produces an average of 15 gpm of wash waters. The treatment system consists of a 4-section tank for equalization, chromate reduction, reaction, and neutralization, followed by a thickener for liquid/solids separation, an oil skimmer and collection sump, emergency dump tank, holding tank, and a final sampling and recycling basin. Half of the treated water from the thickener is reused to conserve water and reduce the total plant effluent. The rest of the water is discharged to the sewer system and receives additional biological treatment before being released into the James River. (Orr-FIRL)
W76-01679

FLUID BED INCINERATION OF WASTES CONTAINING ALKALI METAL CHLORIDES,
Dorr-Oliver Inc., Stamford, Conn. (assignee)
E. J. Roberts, and P. A. Angevine.
United States Patent 3,907,674. Issued September 23, 1975. Official Gazette of the United States Patent Office, Vol 938, No 4, p 1835-1836, September, 1975. 1 fig.

Descriptors: *Waste water treatment, *Industrial wastes, *Metals, *Patents, *Incineration, Sulfur.
Identifiers: Fluidized bed incineration.

A method for the fluid bed incineration of alkali metal chloride containing wastes has been granted a patent. The process is designed for the fluid bed incineration, in the presence of sulfur or sulfurous compounds, of an aqueous combustible organic waste stream contaminated with a minimum of one alkali metal chloride. A body of particulate material is first fluidized in a reaction chamber by passing an upwardly flowing stream of air through the body. The fluidized body is then maintained at a temperature between 800 C and 1000 C in order to burn the organic material and volatilize most of the alkali metal chloride. The unvolatilized alkali metal remaining in the bed is expressed in terms of water-soluble and water-insoluble sodium. Finely divided SiO2 and at least one metal oxide selected from the group consisting of CaO, MgO, Al2O3, and Fe2O3, are introduced into the reaction chamber for reaction with the remaining portion of alkali metal; this forms high-melting alkali metal crystalline compounds. The gaseous and solid reaction products are finally discharged from the reaction chamber for disposal or further treatment. (Orr-FIRL)
W76-01680

AES PROJECT 32, TREATMENT OF ELECTROPLATING WASTES BY REVERSE OSMOSIS.
Plating and Surface Finishing, Vol 62, No 9, p 877, September, 1975.

Descriptors: *Waste water treatment, *Industrial wastes, *Metals, *Reverse osmosis, Membrane processes, Pilot plants.
Identifiers: *Electroplating wastes, Copper cyanide wastes, Zinc cyanide wastes, Zero discharge.

American Electroplaters' Society's (AES) Project 32 is an investigation of the feasibility of using reverse osmosis (RO) for the treatment of electroplating wastes. The main concern is closed-loop treatment of rinse water from specific plating baths with recycle of the valuable plating-chemical concentrate to the plating bath and recycle of the purified water to the rinsing operation. Pilot-scale tests showed that RO was a promising technique for the treatment of rinse water from the following baths: Watts-type nickel; nickel sulfamate; nickel fluoborate; copper pyrophosphate; copper cyanide; zinc chloride; zinc cyanide; and cadmium cyanide. RO did not appear promising for the direct treatment, without nuetralization, of chromic acid wastes. The results from field tests demonstrated the RO can be used to close the loop in copper cyanide plating. Future plans for this project include laboratory tests to be conducted on a zinc cyanide plating solution to determine the stability of the polyamide membrane at high pH values. If the stability is good, a full-scale field demonstration will be conducted using a combined RO-evaporation system for the closed-loop recovery of zinc cyanide rinse water. (Orr-FIRL)

BIOLOGICAL REGENERATION OF ACTIVATED CARBON IN ADVANCED WASTEWATER TREATMENT,
Lehigh Univ., Bethlehem, Pa. Dept. of Civil Engineering.
R. L. Johnson.
Available from the National Technical Information Service, Springfield, Va 22161, as PB-247 298, $5.00 in paper copy, $2.25 in microfiche. Completion Report, June 1975, 89 p, 29 fig, 7 tab, 16 ref. OWRT A-032-PA (1) 14-31-0001-5038.

Descriptors: *Carbon, *Activated carbon, Sands, *Aeration, Costs, *Waste water treatment, Biochemical oxygen demand, *Chemical oxygen demand, Biological treatment, *Tertiary treatment.

Enhancement of biological activity was used for off-line batch regeneration of exhausted carbon and in aerated contactors for in-situ regeneration. After three off-line batch biological regeneration cycles, the carbon capacity exceeded 1.0 lb COD/lb with no apparent reduction in the COD removal rate compared to virgin carbon. In 200 days of aerated contactor operations the apparent capacity was 1.87 lbs COD/lb carbon. The influent COD of 94.6 mg/l was reduced to 30.4 m/l at 1.5 gpm/sq ft with 25 minutes detention. A parallel aerated sand contactor removed over 140 lbs COD/day per 1000 cu ft (ptcfd) at 340 ptcfd loading rate. Carbon operating costs for small physical-chemical treatment plants could be reduced 50% by using aerated contactors and comparat economic savings can be achieved by using t biological activity in tertiary treatment

CLEANING COAL WITH COAL: COAL HU ACIDS FOR REMOVAL OF ACID, IR HEAVY METALS, AND ORGANIC POL TANTS ASSOCIATED WITH USE OF COAL A FUEL,
Missouri Univ., Columbia. Dept. of Chemistry
S. E. Manahan.
Available from the National Technical Info tion Service, Springfield, Va 22161, as PB-247 $4.00 in paper copy, $2.25 in microfiche. Miss Water Resources Research Center, Colun Completion Report, August 21, 1975. 39 p, 5 f tab, 1 ref. OWRT B-110-MO (1) 14-31-0001-41

Descriptors: *Coal, Acid mine water, *Humic acids, Copper, Cadmium, Neutraliza *Ion exchange, Chelation, Heavy metals, Or wastes, *Waste water treatment, Acids, C exchange, *Missouri.
Identifiers: Surface oxidized coal.

Cation exchangers were prepared by surfac idizing Missouri bituminous coal with 6 M acid through which air was bubled. The trea introduces oxygen-containing functional g on the coal surface producing an ion exch with acid-base properties and the capabili chelating metal ions. The sodium form of th exchanger removed sulfuric acid from wate ing the pH from 1.5 to more than 8. Ferrous i 25 mg/l in pH 1.5 sulfuric acid (Simulating mine water) was removed to less than 0.2 m the sodium form of the ion exchanger. A s solution of ferric iron was lowered from 10 to about 0.5 mg/l by the same treatment treated coal was found to chemically reduce iron (III) to iron (II). When passed over th form of the coal ion exchanger, copper and c um levels in neutral solution were lowered fr mg/l to 0.01 and 0.00 mg/l, respectively, and 50 mg/l to 0.02 and 0.01 mg/l respectively. Th ion exchange capacity of surface treated limits its usefulness in treating water. Base-s coal humic acid has a much higher ion exc capacity, and work is continuing on its u wastewater treatment.

INSTALLATION FOR SEWAGE TREATMENT,
Cherne Industrial, Inc., Edina, Minn (assignee).
L. G. Cherne, H. C. Grounds, and H. O. Halvorson.
U.S. Patent No. 3,905,904, 4 p, 2 fig, 6 ref; Official Gazette of the United States Patent Office, Vol 938, No 3, p 1235, September 16, 1975.

Descriptors: *Patents, *Waste water treatment, *Sewage treatment, *Water pollution treatment, *Aeration, *Activated sludge, Microbial degradation, Water quality, Flow control, Equipment.

The invention provides a method of sewage treatment utilizing an acitvated sludge sewage aeration treatment area, such as a sewage treatment channel which provides a variable volume reservoir wherein the volume of sewage under treatment may vary over a substantially broad range, and a sludge settling treatment area. The method comprises the steps of delivering sewage, which is at most partially treated and may include infiltration flow from ground and surface water, into the activated sludge sewage aeration treatment area at variable volume rates which can change from moment to moment during a predetermined daily time period; aerating and circulating the sewage and thereby providing a variable volume mixed liquor of aerated sewage and sludge including microorganisms and solids for further treatment; feeding mixed liquor from the aeration treatment area to the sludge settling treatment area; and treating such mixed liquor at such substantially constant volume rate including separating the sludge from the mixed liquor and discharging the remaining clear liquid effluent from the sludge settling area. The control device may involve a constant volume pump and a control valve which can deliver a constant volume rate regardless of variations in depth. Other flow control devices such as floating weirs can also be used. (Sinha-OEIS)
W76-01715

AEROBIC SEWAGE DIGESTION SYSTEM,
G. A. Milne.
U.S. Patent No 3,907,672, 6 p, 6 fig, 13 ref; Official Gazette of the United States Patent Office, Vol 938, No 4, p 1835, September 23, 1975.

Descriptors: *Patents, *Waste water treatment, *Sewage treatment, *Domestic wastes, Water quality control, Water pollution control, *Aeration, *Sludge digestion, Anaerobic bacteria, Aerobic bacteria, Clarification, Equipment.

The invention combines all desirable steps of sewage treatment with a single tank which is self contained. The tank is divided in sections, so that the sewage may be treated in stages. The objectives of the invention are accomplished by providing a large sealed tank with a waste water influent opening into a first pretreatment settlement chamber and with an outflow from that chamber into an aeration chamber where oxygen is added to the air bearing waste water from which solids have been precipitated. The suspended and dissolved solids are acted upon by aerobic bacteria while circulation within the aeration chamber is encouraged. The the aerated waste water is flowed into a tank where flow is slowed and where materials are again precipitated to clarify the liquid. The clarified liquid then flows out of the tank. While the invention is particularly useful for complete sewage treatment systems for single family units and multiple family units, it has application to sewage treatment systems of varied sizes and can be used as an interim sewage treatment facility before a final system is provided. (Sinha-OEIS)
W76-01717

TREATING WASTE,
Fram Corp., East Providence, R.I. (Assignee).
T. E. Belk, S. S. Blecharczyk, and E. L. Shunney.
U. S. Patent No 3,907,673, 4 p, 4 fig, 8 ref; Official Gazette of the United States Patent Office, Vol 938, No 4, p 1835, September 23, 1975.

Descriptors: *Patents, *Waste water treatment, *Sewage treatment, Water pollution control, Water quality control, *Filtration, Aeration, Packed beds, Adsorption, Equipment.

The invention provides effective treatment of waste produced in small quantities with apparatus that is self-contained, compact, lightweight (e.g., easily installed and carried on a ship), and inexpensive. The invention features a waste treatment system comprising a receiver tank having an inlet for receipt of waste, means for connecting the reciever tank inlet to a source of the waste, and at least one treatment tank connected downstream of the reciever tank for mechanical filtration of solid contaminants and adsorption of liquid contaminants contained in the waste. The treatment tank has a packed bed of adsorbent particles, means to aerate and fluidize the bed of the treatment tank including an aeration inlet below the bed. The tank has a liquid outlet, a recirculation line connected from the liquid outlet to the upstream of the treatment tank and valves connected for control of flow in the system during a treatment cycle. An aeration and fluidization cycle in which air flows through the inlet of the treatment tank fluidizes and biologically regenerates the adsorbent particles. In the recirculation cycle the waste flow through the recirculation line and down through the treatment tank in the opposite direction as the air flow during the aeration and fluidization cycle to reestablish the bed and discharge loosened solids. (Sinha-OEIS)
W76-01718

PURIFICATION OF INDUSTRIAL WASTE WATER,
Regie Nationale des Usines Renault, Paris (France); and Regie Nationale des Usines Peugeot, Paris (France).
R. A. Basseet.
U.S. Patent No 3,907,682, 4 p, 9 fig, 8 ref; Official Gazette of the United States Patent Office, Vol 938, No 4, p 1838, September 23, 1975.

Descriptors: *Patents, *Waste water treatment, *Water purification, *Industrial wastes, Water quality control, Water pollution control, Heat exchangers, Heat flow, *Separation techniques, Thermal conductivity, Convection, Currents(Water), Density currents.

An apparatus is described for purifying industrial waste water so that the various phases of different density can be separated. The waste water contains soluble oils or chemically synthesised liquids which are used as additives in cutting and cooling liquids for machine tools used for metal working. This apparatus is located at the first stage of regeneration where the pre-treatment intended to separate the light and heavy phases and the water takes place. The first compartment in the pretreatment tank has an anti-turbulence partition and a thermal partition, and a heating device having a large heat-exchange area. The heating device when operated sets up convection currents between these two partitions to facilitate the separation of the phases. The anti-turbulence partition may take the form of a perforated plate and the heating device is controlled by a regulating thermostat. The convection currents make it possible to separate the various phases contained in the incoming water in such a way that a state of equilibrium is set up in which the light phase, the intermediate phase and the heavy phase come to lie one above the other. (Sinha-OEIS)
W76-01721

PROCESS OF TREATING WASTE WATER,
Fuji Photo Film Co. Ltd., Kanagawa (Japan). (assignee)
A. Abe, and Y. Usui.
U.S. Patent No 3,909,403, 11 p, 3 fig, 6 ref; Official Gazette of the United States Patent Office, Vol 938, No 5, p 2394-2395, September 30, 1975.

Descriptors: *Patents, *Waste water treatment, *Industrial wastes, *Chemical wastes, Ion exchange, *Anion exchange, Separation techniques, Degradation, Chemical degradation.
Identifiers: Photographic processing, Ferrocyanide ions, Ferricyanide ions.

This invention provides a process of treating waste water containing ferricyanide ions and/or ferrocyanide ions which comprises bringing the waste water containing these ions in contact with a weakly-basic anion-exchange resin. The ions from the waste water are absorbed by the weakly-basic anion-exchange resin which is removed and immersed in an alkaline solution to provide an alkaline concentrated solution of the ions. A strong alkali, a hypochlorite and bromide ions are added to the concentrated solution to adjust the pH of the solution to above 12, and the mixture is heated to temperatures above 50 deg C at normal pressure whereby the ferricyanide ions and/or the ferrocyanide ions are decomposed. (Sinha-OEIS)
W76-01726

CLARIFYING AGENTS FOR WATER,
J. L. Lang.
U.S. Patent No 3,909,406, 5 p, 9 tab, 9 ref; Official Gazette of the United States Patent Office, Vol 938, No 5, p 2395, September 30, 1975.

Descriptors: *Patents, *Waste water treatment, *Sewage treatment, *Industrial wastes, Liquid wastes, *Water purification, Flocculation, Suspended solids, Separation techniques, Settling basins.

This invention provides a process which uses a new flocculating system which settles suspended solids from water at a rapid rate, and produces a satisfactorily clear supernatant portion which may be readily removed as purified water. The flocculating and settling agents are physiologically inert, and non-contaminants in terms of the effects of them upon plants and animals. These compounds are essentially those of polyvalent cations with anions such as aluminate, polyaluminate, aluminosilicate, poly aluminosilicate, borate, poly borate, and the like. The materials are prepared by calcining, i.e., heating at temperatures at which water and carbon dioxide are at least partly expelled. The use of these new clarifying agents is easily carried out, usually by simply mixing the untreated water with either the dry pulverized clarifying agent or a slurry thereof in water, allowing flocculation to take place in a quiescent or gently agitated settling zone, and the purified water removed by decantation, siphoning, pumping off, filtration or any of the known methods or combinations. Recycling of the used clarifying agents is possible using these materials, especially when the flocculated solids are incinerated during the ultimate disposal step. (Sinha-OEIS)
W76-01727

TREATMENT OF WOOL SCOURING WASTES,
George W. Bollman and Co., Inc., Adamstown, Pa. (assignee)
W. A. Heisey.
U.S. Patent No 3,909,407, 5 p, 1 fig, 4 tab, 5 ref; Official Gazette of the United States Patent Office, Vol 938, No 5, p 2395, September 30, 1975.

Descriptors: *Patents, *Waste water treatment, *Water pollution control, *Textiles, *Detergents, Sludge, Heat treatment, Flocculation, Centrifugation, Separation techniques.
Identifiers: *Wool scouring wastes.

The primary object of this invention is to produce a supernatant liquor and a conditioned non-drainable sludge which rapidly, gravity settles so that the supernatant liquor can be discharged directly into a municipal sewer system at acceptable COD levels and the sludge can be continuously and efficiently separated by a solid bowl centrifuge into disposable liquid and solid constituents. A method is provided which will produce sufficient purification of both the liquid and solid components of the wool scouring wastes to permit discharge of these components by conventional methods. In a continuous process the scouring liquor at an elevated temperature is acidified and treated with bentonite while continuously mixing. The acidulated liquid is treated with lime and flocculated while continuously mixing, again at an elevated temperature. Finally the conditioned mixed liquor is transferred to a settling tank where the sludge is removed for further treatment and clear liquid is drawn off for discharge into a sewer system. (Sinha-OEIS)
W76-01728

PROCESS FOR TREATING SEWAGE SLUDGE,
H. H. Neukamm.
U.S. Patent No 3,909,410, 4 p, 5 fig, 6 ref; Official Gazette of the United States Patent Office, Vol 938, No 5, p 2396, September 30, 1975.

Descriptors: *Patents, *Waste water treatment, *Sewage treatment, Water pollution control, *Sludge treatment, *Sludge disposal, Drying, Sewage sludge.

An improved method is described for treating sewage sludge. The sludge in the form of a slurry is continuously distributed onto preheated aggregate pieces which are continuously fed into a lower region of a rotating contractor drum. A portion of the slurry instantaneously adheres to the heated aggregate and the non-adhering slurry passes through perforations in the drum for recycle. The aggregate with adhering sludge is carried upward by means of baffles in the drum and is dumped into a collector trough in the upper region of the drum. This coated aggregate is subjected to further heating as it travels down an inclined path to dry the coating into a hard encrustation and enters a tumbler drum which breaks the sludge coating away from the aggregate and pulverizes the sludge into a dust or powder. This dust is collected as product and the decoated aggregate is recycled. (Sinha-OEIS)

EXTENDED WASTE WATER PURIFICATION IN A GROUP SEWAGE PLANT AS PROTECTIVE MEASURE FOR A LEAK (WEITGEHENDE ABWASSERREINIGUNG IN EINEM GRUPPENKLAERWERK ALS SEENSCHUTZMASSNAHME),
T. Lanowy.
Vom Wasser, Vol 43, p 193-214, 1974. 12 fig, 4 tab, 11 ref.

Descriptors: *Waste water(Pollution), *Water purification, *Sewage treatment, Flood protection, Potable water, Treatment facilities, *Waste water treatment, Industrial wastes.
Identifiers: *Bystrzyca river(Poland), *Lubachow reservoir(Poland), Sanitation problems, Municipal-industrial wastes.

When water, which was originally impounded for flood protection and energy generation, is used for drinking purposes, it is necessary to reorganize the water and sewage policies in the catchment area of the impounding reservoir and to solve numerous sanitation problems. These problems are discussed with reference to the catchment area of the Bystrzyca river and the Lubachow reservoir in Poland. The intended reorganization of water uses will involve: construction of a group sewage plant for about 15000 cu m waste water/day, including a collector to direct the water around the reservoir; construction of a plant for the treatment of impounded water intended for industry located in the neighborhood of the river basin; incorporation of artificial aeration of the reservoir; and construction of an extensive sewage purification plant fr which water can be fed into the reservoir when flow of main tributary water is low. Since waste water to be handled contains more than 6 industrial effluent from dye-house works, tann factories, spinning mills, and other factories, c siderable difficulties will be met in its treatme particularly with regards to decoloration. T results of investigations carried out in an exp mental sewage purification plant as well as potentiality of recovering drinking water with aid of ion-exchange, electrodialysis, and activa charcoal filtration processes are discussed. detailed program of industrial investigation needed to find the optimum sewage purifica process. SAND FILTER AND WASTE STABILIZATI POND TEST SHOWS POSSIBILITY I TREATMENT OF INDIVIDUAL WASTEWA DISPOSAL,
Public Health Service, Grant, N. Mex. Div. of dian Health.
M. L. Beard, and C. H. Lawrence.
Journal of Environmental Health, Vol 38, No 43-44, July/August, 1975. 1 tab, 10 ref.

Descriptors: *Waste water treatment, *Se tanks, Biochemical oxygen demand, Chemical ygen demand, Nitrates, Coliform, Effluents, S dards, Waste water disposal.
Identifiers: *Sand filters, *Waste stabiliza ponds.

iIn order to determine whether or not waste bilization ponds and sand filters are capabl treating individual dwelling or housing cl wastes to a level of effluent superior to the ventional septic tank, four such ponds and such filters were sampled. Bacteriological, ch cal, and biochemical analyses were made for system. A wide range of loading conditions chosen and each unit was sampled weekly fo month. Sand filters were 20 ft by 40 ft by 4 and were preceded by sedimentation in con tional septic tanks. The waste stabilization p served households receiving untreated well and each was also preceded by a septic tan sedimentation. Effluent samples from all units were analyzed using Standard Method BOD, COD, nitrates, and fecal coliform. The filters produced better BOD, COD, and suspe levels than did the waste stabilization ponds. ever, the performance of the ponds was bet terms of producing a much lower nitrate co tration and low levels of effluent fecal colifo was concluded that both types of units Federal effluent standards and do provide a ble alternative to the conventional septic system for disposal of domestic waste w (Kramer-FIRL)

FACTORS TO CONSIDER WHEN SELECTING GRANULAR ACTIVATED CARBON FOR WASTEWATER TREATMENT,
ICI America Inc., Wilmington, Del.
P. B. DeJohn.
In: Proceedings of the 29th Industrial Waste Conference, May 7-9, 1974, Part Two, Lafayette, Indiana, Purdue University, p 790-807, 14 fig, 12 tab.

Descriptors: *Waste water treatment, *Activated carbon, Lignite, Coals, Bituminous materials, Adsorption, Molecular structure.
Identifiers: Bituminous coal carbon.

The selection and use of granular activated carbon in waste water treatment were studied. Before selecting a carbon type, an analysis of cost is advisable; it should be made through a minimum of five adsorption-regeneration cycles. Performance deterioration and price differences between the two carbon types should also be kept in mind. The choice of a granular activated carbon should be based on its meeting effluent standards through impurity adsorption, on moderate losses during regeneration, on minimal pressure drop, absence of operating problems, and on the most economical operating cost. Adsorption data reveals that lignite carbon will be more efficient in dealing with waste water streams which contain pollutants with mostly large molecules while bituminous coal carbon will be preferable when working on streams with predominantly small molecules. In domestic waters, both carbons should give equivalent results. Regeneration data shows that lignite carbon regenerates more easily and under less severe conditions because of its larger pore structure and its greater inert ash content. (Waltner-FIRL)

OZONE DEGRADATION IN PACKED COLUMNS,
Rice Univ., Houston, Tex. Dept. of Environmental Science and Engineering.
M. A. Kessick, and J. V. Matson.
Journal of the Environmental Engineering Division-ASCE, Vol 101, No EE5, p 883-886, October 1975. 2 fig, 4 ref.

Descriptors: Ozone, *Waste water treatment, *Chlorine, *Adsorption, Activated carbon, Zeolites.
Identifiers: Packed columns, *Ozone decomposition.

Ozone has been considered as an alternative disinfectant to chlorine in water and waste water treatment systems. One hazard of ozone treatment is an unacceptable level of gas that might be released to the atmosphere. To minimize this problem, ozone may be adsorbed into potassium iodide solution, thermally degraded in a flare, or decomposed in a packed column. The last of these procedures was evaluated by reaction zone analysis. Destruction of ozone was carried out for both dry and water-saturated gas streams. Carbon column packings of 21-g (49-ml bed volume) dried Pittsburgh Activated Carbon Type SGL 8-30 were used. For purpose of comparison, Linde Molecular Sieve type 13x, a zeolitic material, was evaluated by the same method for ozone decomposition ability. The activated carbon in a packed column demonstrated a performance markedly superior to that of the zeolite. The use of the carbon column was suitable for the continuous removal of small percentages of ozone from a wet or dry gas stream. Carbon was irreversibly degraded at the rate of approximately one g/4 g ozone destroyed. The weight loss (about 0.35 g/4 g ozone destroyed) indicated that a catalytic or thermal mechanism as well as a chemical reaction had contributed to the degradation. (Kramer-FIRL)

SANITARY SURVEYS AND SURVIVAL CURVES OF SEPTIC TANK SYSTEMS,
J. T. Winneberger.
Journal of Environmental Health, Vol 38, No 1, p 36-39, July/August, 1975. 1 fig, 2 tab, 6 ref.

Descriptors: *Septic tanks, *Surveys, *Sewers, *Sewerage, Public health, Costs, *Waste water treatment.
Identifiers: Septic tank survival curves.

An argument is presented in favor of reviewing presently operating septic tank systems rather than arbitrarily replacing them with sewers. It is believed that many federally funded sewerage projects have been unnecessary, and have led to urbanization of reluctant communities. Two unincorporated communities in California are compared, both with the same terrain and the same septic-tank practices. One had small, city-size lots and the other had larger lots. While septic tank problems in the city with the small lots were immediately realized when sewage spilled into a neighboring property, in the case of the large lots, nuisances were less often noticed. Survival curves and failure rates for the two systems were compared, and it was found that the small lots had a 17% failure, while the large lots had a failure rate of 15%, or about the same. The survival curves indicated that about 50% of the systems survived 25 years. This rate is deceptive, because the types of repair and amounts of time for the septic tank to again be operable vary. It was recommended that further sanitary surveys be conducted and that the choice of building sewer systems rather than improving septic tanks be re-evaluated. (Kramer-FIRL)

DEVELOPMENTS IN BACKWASHING OF GRANULAR FILTERS,
Iowa State Univ., Ames. Dept. of Civil Engineering; and Iowa State Univ., Ames. Engineering Research Inst.
J. L. Cleasby, E. W. Stangl, and G. A. Rice.
Journal of the Environmental Engineering Division, Proceedings of ASCE, Vol 101, No EE5, p 713-727, October, 1975.

Descriptors: *Water treatment, *Filtration, *Filters, Equipment, *Waste water treatment.
Identifiers: *Backwashing, *Filter cleaning.

Three methods of backwashing granular filters are evaluated. The effectiveness of: water fluidization only; air-scour followed by water backwash; and surface wash before and during water backwash were tested when filtering different types of waters. Previous studies have shown that the cleaning of granular filters by the upward flow of backwash water alone to fluidize the filter bed is a weak method because particle collisions do not occur in a fluidized bed. Therefore, auxiliary means of improving filter bed cleaning are employed. Experimental testing involved the utilization of three different filters operated in parallel, the filtering of water later followed by two different waste waters, sampling of influent and effluent flows, readings of turbidity and head loss, standard abrasion testing of core samples taken from the media after the backwash, and visual observation. Results support findings on the weakness of water fluidization only, and consolidate the advantages of the auxiliary methods in maintaining the filters in better condition. It was also found that heavy mud ball concentrations are undesirable since they increase initial head losses and help shorten filter cycles; filter cracking will let solids penetrate deeper into the filter and may lower filtrate quality in some instances. Proper backwashing with the auxiliary methods neces-

sitates the expansion of the coals and sands usually specified in dual and mixed media filters. Air-scour systems are described which require special attention in design and utilization. (Waltner-FIRL)

GREATER VANCOUVER OPENS ANNACIS TREATMENT PLANT,
G. Matheson.
Water and Pollution Control, Vol 113, No 9, p 14-16, September 1975.

Descriptors: *Waste water treatment, *Sewage treatment, *Treatment facilities, Automation, *Canada, Dewatering, Chlorination, Operating costs, Personnel.
Identifiers: *Vancouver(BC).

Greater Vancouver (British Columbia) Regional District's recently opened Annacis Island Sewage Treatment Plant is presently providing primary treatment while the Frazer estuary is being tested for possible secondary treatment. The plant is mainly concerned with the elimination of pathogens and toxicity to fish and with the preservation of the estuary's aesthetic qualities rather than with the maintenance of low nutrient levels. Designed to serve 490,000 people by 1986, it is also high automated; an older plant would employ one man per one mgd while the Annacis Island plant uses one man per three mgd. The processes involved in primary treatment comprise influent sampling, pre-chlorination, screening, pumping to preaeration and grit removal, followed by thickening, high rate digestion, and drying and storage in sanddyke lagoons; grit and scum dewatering; post chlorination in contact tanks with dechlorination; and effluent sampling, metering and discharge through an outfall fitted with diffusers. Operating costs are divided among the eleven municipalities according to the value of real property in the collection districts. (Waltner-FIRL)

PROCESS CLOSES LOOP ON SEWAGE TREATMENT.
Chemical and Engineering News, Vol 53, No 40, p 6-7, October, 1975.

Descriptors: *Sewage treatment, *Waste water treatment, *Pilot plants, Activated carbon, Heavy metals, Suspended solids, Standards, Costs.

A pilot plant is to be built in southern California which will test a new treatment process whereby solids in the sewage are converted to activated carbon. These are in turn utilized to treat the incoming waste water. The plant will be a magnification of an already existing mobile unit where the treatment process almost completely eliminated sewage solids, produced clean waste water and removed odors and heavy metals in the sewage. It is expected that the process will exceed EPA standards at a lower cost. (Waltner-FIRL)

ADSORPTION OF INORGANIC MATERIALS ON ACTIVATED CARBON,
Oak Ridge National Lab., Tenn.
F. Nelson, H. O. Phillips, and K. A. Kraus.
In: Proceedings of the 29th Industrial Waste Conference, May 7-9, 1974, Part Two, Lafayette, Indiana, Purdue University, p 1076-1090. 20 fig.

Descriptors: *Waste water treatment, *Activated carbon, *Adsorption, Anions, Cations, Tracers, Analytical techniques, Laboratory tests.

Recent experiments dealing with adsorption phenomena typical of activated carbon are reviewed. The relative extent of anion and cation uptake is determined by means of the 'double tracer technique' and as a function of pH. Small columns are preequilibrated with the electrotype solutions. A solution of the same composition but which contains the appropriate tracer is then passed through the column bed and the effluent is monitored for appearance of the tracer. If the kinetics of exchange is satisfactory, a typical, symmetrical breakthrough curve is obtained. The greater part of the study made use of either commercial, powdered activated carbon Aqua Nuchar A or of a granular coconut charcoal. Most analyses were made radiometrically with appropriate gamma emitting isotopes or by standard atomic methods. Alkali metal separations demonstrated cation exchange properties found at high pH and to a certain extent in neutral solutions of activated carbons. Secondly, the uptake of electrolytes from neutral and slightly acidic solutions was illustrated. A distinction was made between cases where the cation was a metal and where it was the hydrogen ion. Adsorption and separation methods made possible at high ionic strength were examined. Finally, experiments were reviewed where activated carbon is modified by the adsorption of organic acids and by the incorporation of hydrous oxides. (Waltner-FIRL)

TECHNOLOGY AND $20 BILLION ADVANCE WASTEWATER EFFORT.
Engineering News Record, Vol 195, No 13, p 18-31, October 1975.

Descriptors: *Waste water treatment, *Tertiary treatment, Treatment facilities, Costs, Government finance, Sludge disposal, Capital costs.

The construction of advanced water treatment (AWT) facilities to combat water pollution is estimated at two billion. The major impediment is cost. The research budget for AWT has been cut back in recent years; EPA's research allocations are mostly spent on already existing plants and processes. The National Commission on Water Quality's final report on costs and benefits will be released in March and is expected to greatly influence the development of the AWT market. In addition, there is hesitation on the part of municipalities and industries. Some feel that secondary projects not yet put into effect should be given precedence over AWT. Some recommend further research before the project is undertaken but caution against too long a delay. Others want to reexamine the need for AWT at all. Moderate views support the installation of AWT plants where secondary treatment is inadequate. The many processes available to remove remaining pollutants of secondary effluents are reviewed. The largest portion of the AWT research budget is devoted to the problem of sludge disposal. More than forty percent of the capital cost of a treatment plant is utilized in sludge handling. While the United States is more advanced than other countries in AWT technology, Israel, Germany and the USSR all have AWT research or plants. AWT activity is growing in Japan, and Sweden is starting a full-size program. (Waltner-FIRL)

REHABILITATION OF A RECREATIONAL LAKE THROUGH AREAWIDE SEWERAGE.
Public Works, Vol 106, No 10, p 98-99, October 1975.

Descriptors: *Sewerage, *Waste water treatment, *Treatment facilities, Lakes, Rivers, Water quality control, Septic tanks, *Wisconsin, Sewer systems.
Identifiers: Gravity sewers, Lake Koshkonog(Wis), *Lake rehabilitation.

In 1970, a waste water collection system and treatment facilities for sewage from four townships around Lake Koshkonog, Wisconsin, were proposed to replace the existing septic tank systems. The lake shore soil conditions did not favor the continued use of septic tanks, and the construction of areawide sewerage was viewed as a solution to the deterioration of the lake wat quality. A sanitary district was organized, a facilities to accomodate 5590 connections we designed. The collection system for the was water was complicated by having to follow on third of the lake shore and part of the Rock Rive necessitating providing 125,000 linear feet of inch to 24-inch gravity sewers and 25,000 feet force mains. Treatment for the collected wa was provided by the concentration of wastes to single discharge point. An aerated lagoon syste was used, consisting of three lagoons, each with surface area of 2.3 acres. Their combined capac was 18 million gallons, at a flow rate of 600,0 gpd. The lagoons operate in series, and retention the design flow is about 30 days. BOD loading w estimated to be 1020 pounds per day. Monitor and laboratory testing at the lagoons has been i plemented and routine duties include check blower operation, reading meters, recording pr sures and waste water flow and chlorine use, c lecting samples and performing laboratory te for BOD, DO, suspended solids, pH, and chlor residual. The facility has been in operation sin August 1973. While no analytical measurement the lake and river quality have been made since sewerage system was installed, improvement been noticeable in terms of reduced weed gro and odor. (Kramer-FIRL)

iptors: *Flocculation, *Coagulation, Mixing, ratory tests, Turbidity, Flow characteristics, tical techniques, *Waste water treatment. fiers: Floc properties, Colloidal charac- cs.

cription of the flocculation and coagulation sses in turbulent flow is presented. Because nt systems require short reaction times and a sity of coagulants are used, the effects of y dissipation of the destabilization and trans- phases is important. This study investigated e the distribution of velocity gradients in the on chamber was significant, and would fore invalidate the concept of an average velocity gradient. Two different clay nsions were coagulated with Na+, Ca2+, Hercofloc at a constant pH. In a jar test, tur- propeller-type and anker-type stirrers were all three stirrers required the same energy in the region of investigated speed. How- the coagulation rates for the stirrers were d to be different, contradicting the premise of erage linear velocity gradient. The anker-type r provided the most uniform distribution of urbulence. This is dependent upon floc pro- es, determined by the colloidal characteristics he coagulant. It was concluded that the dis- tion of turbulence created by different stirrers eaction chamber is an important parameter to nsidered. (Kramer-FIRL)

as been estimated that Hawaii, which is served ost solely by groundwater supplies, had suffi- t water until the year 2020. However, recent ulation and water use increases have out- pped these estimates. Four years ago a study of reclamation and recylcing of sewage waters for gation was started. A reevaluation of this study a review of carbon chloroform extract (CCE) a is discussed. At the beginning of the study E concentrations for rural, agricultural and wil- e areas indicated excellent water quality. DDT other chlorinated hydrocarbons, indicated in er studies, were not found in detectable ounts. Infrared spectra of organic extracts were complicated to be analyzed, but they did in- ate the possible presence of phenols. Biochemi- oxidation demand and chemical oxidation de- nd were used as indirect measurements of the ount of organic matter, but now direct destruc- n of carbon in the infrared detection total car- n oxidation unit can give a more direct measure- nt. Studies were performed at Mililani Town, waii, on the feasibility of using sewage plant ef- fluent for irrigation. To kill enteric viruses effectively very large amounts of chlorine are needed. Studies on an alternative material, virucide bromin chloride, are suggested. It was also found that data on CCE from sewage are scarce. (Pinto-FIRL)

WATER RENOVATION USING DEEP NATURAL SAND BEDS,
Rensselaer Polytechnic Inst., Troy, N.Y.
. Hajas, N. L. Clesceri, J. Tofflemire, S. Beyer, and L. Hajas.
Journal of the American Water Works Association, Vol 67, No 9, p 510-515, September, 1975. 5 fig, 2 tab, 9 ref.

Descriptors: *Waste water treatment, *Sewage treatment, Infiltration, Flood plains, Effluents, Aerobic conditions, Pollutant identification, Groundwater, Nitrogen, Phosphorus, Treatment facilities, New York.
Identifiers: *Lake George(NY).

Waste water purified by the Lake George Village sewage treatment plant in New York was tested in order to determine whether the final effluent is being safely treated for its ultimate discharge into Lake George. Seepage from the banks of the flood plain of West Brook, which ultimately flow into the lake, was analyzed, and aerobic conditions were found in the groundwater between the treatment plant and West Brook. Samples taken from several wells and other locations were analyzed for temperature, dissolved oxygen, dissolved solids, pH, soluble phosphorus, N03-N, NH3-N, coliforms and chlorides. These samples were made during each season, because the Lake George area has a seasonal increase in population due to summer tourism and a heavy runoff from spring snow melt. It was found that chloride were not diminshed, phosphorus was completely removed, and a nitrified effluent was produced which appears to have no obvious negative effects upon the Lake George water quality. Thus, effluent polishing using infiltration beds does achieve a sufficient degree of purification. (Kramer-FIRL)
W76-01765

THE EFFECTS OF OZONE DEODORIZATION EQUIPMENT FOR THE SEWAGE ODOR (GESUI SHUKI NI TAISURU OZON DASSHUSOCHI NO KOKA),
K. Nishida, T. Honda, and T. Tsuji.
Akushu no Kenkyu, (Odor Control Association Journal), Vol 4, No 20, p 24-30, May, 1975. 5 tab, 11 ref.

Descriptors: *Ozone, *Sewage, *Odor, *Waste water treatment, Sewage treatment, Equipment, Gas chromatography, Photometry, Treatment facilities, Analytical techniques, Measurement, Hydrogen sulfide, Ammonia.

The effectiveness of ozone deodorization equipment for eliminating sewage odors was determined. The concentrations of odor-causing compounds at a sewage treatment plant in Osada, Japan, were measured before and after ozone treatment. The plant in Osaka, Japan, were measured before and after ozone treatment. The plant treated 4000 to 10,000 cu m gas per hr in an ozone reaction bath. The rate of ozone injected into the bath was 150 g/hr. The gas samples before and after the treatment were collected and analyzed by gas chromatography using a flame photometry detector and a PEG 20 M column. The ozone concentration injected into the bath was 1530 to 1710 ppm and the ozone level in the treated gas was 0.13 ppm. The residual ozone was treated at another bath, lowering the ozone concentration to below 0.01 ppm before the final discharge into the air. A gas chromatogram showed 12 peaks, indicating concentrations in the untreated gas of methyl mercaptan, 16.9 ppm; dimethyl sulfide, 1.30 ppm; hydrogen sulfide, 0.30 ppm; ammonia, 0.0052 ppm; trimethyl amine, less than 0.0005 ppm; n-propyl mercaptan, 31.3 ppm; and n-amyl mercaptan, 4.75 ppm. The concentrations of the corresponding compounds in treated gas were: 12.6 to 12.8 ppm; 0.72 to 1.12 ppm; 0.29 to 0.0098 ppm; 0.0026 to 0.0047 ppm; less than 0.0005 ppm; less than 0.01 ppm; and 1.64 to 4.20 ppm. Thus, ozone removal efficiencies were 24.3 to 25.5% for methyl mercaptan; 13.9 to 44.6% for dimethyl sulfide; 3.4 to 96.8% for hydrogen sulfide; 9.7 to 30.8% for ammonia; better than 99.9% for n-propyl mercaptan; and 11.6 to 65.5% for n-amyl mercaptan. OPTIMIZATION OF FILTRATION FOR SURFACE WATER TREATMENT (OPTIMIERUNG DER FILTRATION BEI DER OBERFLAECHENWASSERAUF-BEREITUNG),
M. Kavanaugh.
Vom Wasser, Vol 43, p 53-71, 1974. 8 fig, 12 ref.

Descriptors: *Model studies, *Filtration, *Laboratory tests, Polyelectrolytes, Filters, Surface waters, *Waste water treatment.
Identifiers: Particulate collection, Head loss buildup.

A simple model of particulate collection and headloss buildup in granular media filtration has been developed. Assumptions made in design of this model were substantiated through filtration experiments conducted in small laboratory columns (ID = 10 cm) using glass beads as media and latex microspheres as model colloids. One application of the model was illustrated by a hypothetical design problem for contact filter treating a clay suspension destabilized with a cationic polyelectrolyte. By using pilot plant scale tests, the model should be useful in estimating optimum process conditions for a given filtration problem. (Kramer-FIRL)

The Chemical Engineering Journal, Vol 9, No 2, p 107-114, April, 1975. 10 fig, 1 tab, 7 ref.

Descriptors: *Aeration, *Model studies, Mathematical models, Mixing, Flow measurement, Oxidation lagoons.
Identifiers: *Aeration tanks, Retention time distribution.

Few investigations have been conducted on the mixing in an aeration tank, and either perfect mixing or plug flow has generally been assumed. In this study, the Retention Time Distribution (RTD) was determined in a 12 cu cm tank aerated by coarse bubble diffusers. Mixing was independent of liquid flow in the test range but increased with air flow. The RTD curves were interpreted by a model of two unequal perfectly stirred reactors. Experimental curves were fitted to the model with peak time. Thus, the model parameter was linked to air flow and agreement between experimental and theoretical curves was determined to be good. ORGANICS, WATER, AND HEALTH: A REUSE PROBLEM,
California State Dept. of Health, Los Angeles. Water Sanitation Section.
A. W. Reinhardt, D. P. Spath, and W. F. Jopling.
Journal of the American Water Works Association, Vol 67, No 9, p 477-480, September, 1975.

Descriptors: *Water reuse, *Organic matter, *Waste disposal, Waste water treatment, Water supply, California, Public health, Recycling, Recharge, Groundwater, Water resources development, Organic wastes.
Identifiers: Reclaimed waste water.

The use of reclaimed waste water for augmenting domestic water sources is discussed as a major cause for health concern due to effects of stable organic material in the waste water. While reclaimed waste water has been used for crop irrigation of crops with little public contact, the usage has been expanded to include public areas. The last use of reclaimed water has been direct discharge for supply augmentation into a domestic water system or storage facility. The California State Department of Health strongly recommends against the continued use of recharge operations which increase the stable organic loadings of groundwater used for domestic supply. The health effects of such organic materials remain unknown and research is as yet in a preliminary stage. Plans for new spreading and injecting facilities, including the Anaheim Forebay Reclamation Project and the Los Angeles Water Recycling Project, are under review. (Kramer-FIRL)

ALARM SYSTEMS PROVIDE LOW COST ENVIRONMENTAL PROTECTION,
Beavin Co., Baltimore, Md.
C. E. Walter.
Public Works, Vol 106, No 10, p 88-89, 112, October, 1975.

Descriptors: *Automation, *Treatment facilities, *Waste water treatment, *Pollutant identification, Equipment, *Monitoring, Installation, Control systems, Costs.
Identifiers: *Alarm systems, System malfunction, Automatic telephone dialer.

The use of automated alarm systems for waste water treatment plants and pumping stations is discussed. To be effective, these malfunction alarms must attract human attention and must generate a response. It is recommended that the alarms be designed to transmit a signal to a remote location which is manned 24 hours a day so that the alarm will receive immediate attention. The types of failures or malfunction that can be detected include power failure, high water, loss of air in an activated sludge plant, excessive turbidity, excessive sludge accumulation, pump or motor failure, primary tank malfunction, high or low chlorine residual, or chlorine gas leaks. The Mount Airy, Maryland, treatment plant is cited as an example where the alarm system has been custom designed and fabricated. A less sophisticated equipment may be used to monitor a small treatment plant, adapting standard burglar alarm components. Receivers of an alarm signal can be placed in a police or fire station so that when a failure alarm is signaled, the appropriate plant operator will be contacted. Another type of burglar alarm system is an automatic telephone dialer, which is activated by the alarm system controller to automatically call as many as four different telephone numbers, sending the recorded message to each. Costs of basic detectors, control unit, and telephone dialer were estimated to be $500 per plant; installation costs should not exceed $500. (Kramer-FIRL)

THE USE OF WASTE HEAT IN A SYSTEM FOR ANIMAL WASTE CONVERSION WITH BY-PRODUCT RECOVERY AND RECYCLING,
Oregon State Univ., Corvallis. Dept. of Soil Science.
L. E. Boersma, W. R. Barlow, J. R. Miner, H. K. Phinney, and J. E. Oldfield.
Available from the National Technical Information Service, Springfield, Va 22161 as PB-247 555, $4.00 in paper copy, $2.25 in microfiche. Oregon Water Resources Research Institution, Corvallis, Report WRRI-38, October 1975. 33 p, 4 fig, 15 tab, 35 ref. OWRT B-039-ORE(3). 14-31-0001-4121.

Descriptors: *Recycling, *Byproducts, Natural resources, *Waste treatment, Algae, Microorganisms, Cultures.
Identifiers: Non-renewable natural resources, Photoautrophic algae, *Waste heat, *Animal waste conversion.

Society faces many problems related to its growth in numbers and standard of living. Of major concern are the consumptive use of non-renewable natural resources and the environmental degradation resulting from pollution. An animal waste management scheme was developed on the premise that one solution to these problems is the development of integrated production systems with recycled resources. It is proposed to use microorganisms to convert animal waste into a high protein animal feed and a methane-rich fuel gas. A conceptual design for such a system is described and results are presented of preliminary experiments conducted in the laboratory. It was decided to use photoautrophic algae for nutrient recovery. Data are presented which demonstrate that based on its mineral composition swine manure is a suitable medium for algal growth. The most encouraging aspect of the laboratory studies has been the stability of the cultures. The average growth rate at 37C during a 12 hour period with a retention time of 3.3 days and a culture depth of 10 cm was about 22 g/m2/day. The consistently high yields of cell dry matter and protein has been encouraging.

J. D. Gallup
Available from the National Technical Information Service, Springfield, Va 22161 as PB-238 079 $6.75 in paper copy, $2.25 in microfiche. EPA Report 440/1-74-016-a, Contract No 68-01-0594 March, 1974. 166 p, 6 fig, 70 ref, 24 tab.

Descriptors: *Tannery wastes, *Waste water treatment, *Water quality standards, Wastes, Industrial wastes, Water pollution sources, Water quality control, Costs, Operating costs, Capital costs, Water pollution, Water pollution control, Water quality, Waste treatment, Water pollution treatment, Standards, Economics, Effluents, Regulation.
Identifiers: *Leather industry.

This document presents the findings of an extensive study of the leather tanning and finishing industry for the purpose of developing effluent limitation guidelines. The guidelines set forth the degree of effluent reduction attainable through the application of the best practicable control technology currently available and the degree of effluent reduction attainable through the application of the best available technology economically achievable; these levels of treatment must be achieved by existing point sources by July 1, 1977 and July 1, 1983, respectively. Supporting data and rationale for the development of the proposed effluent limitation guidelines and standards of performance are presented. Manufacturing processes, wastes, and waste treatment methods and their costs are discussed. (Witt-IPC)

CARBON, NITROGEN, AND PHOSPHORUS REMOVAL IN STAGED NITRIFICATION DENITRIFICATION TREATMENT,
District of Columbia Dept. of Environmental Services, Washington. EPA-DC Pilot Plant.
J. A. Heidman, D. F. Bishop, and J. B. Stamberg
Environmental Protection Agency, Report EPA-670/2-75-052, June 1975. 37 p, 12 fig, 11 tab, 5 ref. 1BB043; ROAP 21-ASO; Task 017. 68-01-0162.

Descriptors: *Nitrification, Carbon, *Sewage treatment, Aeration, Nitrogen, Phosphates, *Activated sludge, Oxides, Sulfates, *Anaerobic conditions, Iron, Chlorides, Oxygen, *Filtration, *Waste water treatment, Dissolved gases, District of Columbia.
Identifiers: *Denitrification, EPA-DC Pilot Plant(Washington DC).

A three-stage activated sludge system with mine addition for nutrient removal was operated w District of Columbia primary effluent. Influ flow followed a programmed diurnal cycle a averaged 205 cu m/day (54,000 gpd). The fi biological reactor was operated as a modified ae tion system with ferric chloride addition for s plemental phosphorus removal. The clarified fluent then flowed to the second reactor for biological nitrification of ammonia and orga nitrogen. Dry lime was used for pH cont Methanol was added to the nitrified effluent, biological denitrification occurred in the final tivated sludge system. Prior to clarification, denitrification effluent was briefly aerated nitrogen gas removal and for consumption of excess methanol. The clarified effluent was th split into two equal streams for comparison of tration performance of a dual-media coal and sa filter with that of a multi-media coal, sand, and menite filter. Effluent quality consistently met proposed D.C. discharge standards of BOD is

or equal to 4.5 mg/l; total N less than or equal 5 mg/l; and P less than or equal to 0.22 mg/l.)

MOVAL OF CHROMIUM FROM PLATING NSE WATER USING ACTIVATED CARBON,
ttelle, Columbus Lab., Ohio.
B. Landrigan, and J. B. Hallowell.
vironmental Protection Agency, Report EPA-0/2-75-055, June 1975. 43 p, 10 fig, 6 tab. 1BB036 OAP 21AZO, Task 17). S-802113.

scriptors: *Activated carbon, *Activated car-n, Adsorbents, *Adsorption, Industrial wastes, aste water treatment, *Chromium.
ntifiers: Rinse water, Waste recovery, Metal ishing, Electroplating.

romium is a major pollutant in wastewaters m some electroplating operations. It can be ef-ctively removed from rinse waters by adsorption activated carbon, which must be regenerated en saturated with chromium to its upper limit. is study was concerned with the best means of generating the carbon under conditions which ould return it as closely as possible to its original sorptive capacity. The tests were conducted (1) a laboratory scale to determine the effects of sic and acidic media on regeneration of chromi-n-loaded activated carbon and (2) in a small pilot ant unit on the basis of the best results of the oratory-scale work. In the latter case, tests ere conducted on the unit operation for eight ad-rption-desorption cycles. The overall results ggest that a chromium removal unit could be in-alled in many of the small plating plants, reliev-g the burden on municipal sewage systems, and bringing the plating plant into compliance with local and Federal regulations. Recommendations for improvement of the regeneration process are given even though the process could be used in its present stage of development. (EPA)

MULTI-PURPOSE COMBINED SEWER OVERFLOW TREATMENT FACILITY, MOUNT CLEMENS, MICHIGAN,
V. U. Mahida, and F. J. DeDecker.
Environmental Protection Agency, Report EPA-670/2-75-010, May 1975. 204 p, 45 fig, 19 tab, 24 ref, 3 append. 1BB034; ROAP 21-ASY; TASK 149. 11023 FAR.

Descriptors: Cost comparison, Water quality, *Filtration, Sewers, *Chlorine, Surface runoff, *Water supply, Water conservation, *Overflows, Recreational facilities, Standards, Storage, *Disinfection, *Chlorination, *Combined sewers, *Waste water treatment, Treatment facilities.
Identifiers: *Microstraining, *Combined sewer overflow, *Storm runoff, Urban water management, Multi-purpose treatment, Clemens(Michigan), Stormwater reuse.

Combined sewer overflows from 212 acres within the City of Mount Clemens were conveyed to a treatment-park site. The overflows received initial treatment (settling and surface aeration) in a retention basin. Further treatment consisted of microstraining disinfection, surface aeration in a series of lakelets, and filtration. The annual existing overflow of 2180 cu ft/acre-inch of rainfall had SS of 50 lbs/acre-inch and BOD5 of 20 lbs/acre-inch. Treatment reduced the annual pollution load by 90 percent. The final lake sampling data had demonstrated that all water quality parameters for fishing, boating, and/or lawn sprinkling--except the toxic and deleterious substances parameters, which were not studied--were met. Very limited investigations were undertaken in the area of recreation, open space, and transitional land use. Treatment of combined sewer overflows was more cost-effective than separation of an existing combined sewer system. (EPA)

GUIDELINES FOR THE DISPOSAL OF SMALL QUANTITIES OF UNUSED PESTICIDES,
Midwest Research Inst., Kansas City, Mo.
E. W. Lawless, T. L. Ferguson, and A. F. Meiners.
Environmental Protection Agency, Report EPA-670/2-75-057, June 1975. 330 p, 4 fig, 12 tab, 166 ref, 5 append. 1BB041; ROAP 21AVO; Task 002. 68-01-0098.

Descriptors: *Pesticides, *Herbicides, *Insecticides, Waste treatment, Waste disposal, Incineration, Neutralization, Oxidation, Reduction(Chemical), Degradation(Decomposition), Water pollution treatment.
Identifiers: Pesticide spills, Pesticide manuals, Pesticide disposal.

Information has been compiled and organized that will be useful to responsible authorities in advising the layman (particularly the homehowner and small farmer) how to dispose properly of small amounts of surplus and unwanted pesticides and pesticide containers, and in treating pesticide spills. The report brings together available information on pesticide disposal methods and on over 550 individual pesticides, and evaluates this information in terms of the experience and equipment that the average layman has. Fourteen pesticide disposal procedures are described and procedures for disposal of containers and cleanup and treatment of spills are included. Preferred and alternate disposal procedures are recommended for over 550 pesticides. Included are a cross-index of over 1,600 pesticide names, tables showing the chemical composition and properties pertinent to disposal of the selected pesticides and bibliography of 166 references. TREATMENT AND ULTIMATE DISPOSAL OF CATTLE FEEDLOT WASTES,
Kansas State Univ., Manhattan.
H. L. Manges, R. I. Lipper, L. S. Murphy, W. L. Powers, and L. A. Schmid.
Available from the National Technical Information Service, Springfield, Va 22161 as PB-244 185, $6.00 in paper copy, $2.25 in microfiche. Environmental Protection Agency, Report EPA-660/2-75-013, June 1975. 136 p, 44 fig, 26 tab, 78 ref. 1BB039. S800923.

Descriptors: Anaerobic conditions, *Waste disposal, Water pollution, Cattle, Rainfall, Soil chemistry, Soils, Fertilization, Groundwater, *Ultimate disposal, *Farm wastes, *Feed lots, Great Plains, Environment, *Waste treatment, Kansas.
Identifiers: Water pollutants.

A study was conducted to determine the characteristics of beef feedlot wastes, both runoff and manure, and the optimum application rate of these wastes to land. The project was located at a commercial beef feedlot in southcentral Kansas. Characteristics of beef feedlot wastes varied widely with season. Near maximum corn forage yields, without excessive accumulation of salt in the soil, were obtained from waste application rates necessary to meet nitrogen fertilizer recommendations. At these waste application rates, basic intake rate of water into the soil was increased. Net income from irrigated corn production was sufficient to make application of feedlot manure with disposal as the main objective unprofitable. Land application rates of beef feedlot wastes should be based upon the results of laboratory analyses of wastes from each feedlot. Feedlot wastes should be applied at rates necessary to meet nitrogen fertilizer recommendations. A salt-alkali test should be made annually on the surface soil to monitor changes in soil salinity levels. (EPA)

5E. Ultimate Disposal Of Wastes

WASTE CONVERTER,
Standard Products Co., Cleveland, Ohio. (assignee).
H. W. Green, and O. F. Cook.
United States Patent 3,906,873. Issued September 23, 1975. Official Gazette of the United States Patent Office, Vol 938, No 4, p 1575, September, 1975. 1 fig.

Descriptors: *Patents, *Waste disposal, *Incineration, *Sewage disposal, Equipment, Waste disposal.

A method of sewage disposal has been patented. Equipment consists of a vaporizing chamber and means for discharging wastes downward into the chamber. Flaming combustion products are in-

troduced into the chamber at a rate sufficient to maintain a flame-filled condition within the chamber. A high proportion of the sewage products are thereby vaporized and consumed. Exhaust means are connected to the upper portion of the chamber, and separation equipment is located in the exhaust means to remove solids from the exhaust. (Kramer-FIRL)

CHICAGO'S SYSTEM OF SLUDGE TRANSPORT TO LAND RECLAMATION SITES.
Public Works, Vol 106, No 8, p 72, August, 1975.

Descriptors: *Sludge disposal, *Lagoons, *Treatment facilities, Sludge treatment, Transportation, Recycling, Pumps, Waste water treatment, Illinois.
Identifiers: Land application, *Chicago(Ill).

Sludge removal from waste water treatment plants is being undertaken at two locations in the Chicago area. At the Lawndale Avenue lagoon facility, which serves as the storage area for sludge from the West-Southwest treatment works, sludge removal is handled directly by the Metropolitan Sanitary District of Greater Chicago. At the Calumet treatment works, the operation is being handled by private contractors. At each location, sludge is transferred from the lagoons to bulk carriers by submersible pumps placed directly in the lagoons. Sludge from Lawndale is discharged to barges on the adjacent Chicago Sanitary and Ship Canal, which will deliver it to a Fulton County site about 180 miles away. The dense sludge is moved to the barges by two Flygt CS-3300 pumps; mixers fluidize the sludge so that the concentration is under 8 percent. At the destination in Fulton County, each barge is unloaded by pumps and conveyed 11 miles for storage before land application. Sludge which has been stored in Calumet lagoons from 10 to 20 years is pumped out directly to railroad tank cars, each with a capacity of 20,000 gallons. The solids content of this sludge is more than 12 percent. A special rake blade traverses the lagoon and draws the sludge to the point of pumping at the lagoon edge. Four Flygt B-2250 submersible pumps are supported by a pier near the lagoon edge and hoses discharge to the tank cars through a pipeline 6700 feet long. Trains take the sludge daily to the Shawnee National Forest and to Arcola, Illinois, for disposal as fertilizer and soil conditioner. (Kramer-FIRL)

Journal Water Pollution Control Federation, Vol 47, No 8, p 2067-2087, August, 1975. 4 fig, 8 tab, 11 ref

Descriptors: *Waste disposal, *Irrigation, Drainage, Sugarcane, Grasslands, Nutrient removal, Viruses, Recycling, Effluents, *Hawaii.
Identifiers: *Waste reuse, Land application, Oahu(Hawaii), Enteric viruses, Total organic carbon.

Determination of the feasibility of applying secondary treated waste water effluent to selected land areas on the island of Oahu, Hawaii, is discussed. Grassland and sugarcane culture were irrigated with waste water effluent to ascertain the probable effects on groundwater quality, particularly in terms of dissolved solids and enteric virus transmission and survival. Also, the total sugar cane production and purity were determined for sugar cane cultured in test plots receiving waste water effluent. A combination of grass and soil removed almost all detectable amounts of nitrogen and phosphate from waste water effluent, and between 90 and 95 percent of TOC, suspended solids, and boron. Sugar cane fields showed the same general results. Human enteric viruses were found to have generally surfived secondary waste treatment. However, the soil was effective in removing the viruses from the secondary effluent. (Pinto-FIRL)

ENVIRONMENTAL CONSIDERATIONS OF SANITARY LANDFILL SITES: PART I,
Dames and Moore, Los Angeles, Calif.
J. A. Fischer, and D. L. Woodford.
Public Works, Vol 104, No 6, p 93-97, 1973, 4 fig, 2 tab.

Descriptors: *Sites, *Landfills, Sanitary engineering, Geology, Environmental effects, Groundwater, Leachate, Hydrology, Biochemical oxygen demand, Chemical oxygen demand, Chlorides, Nitrates, Impervious soils, Topography, Climates, Rock properties, Aesthetics.

Proper selection of sanitary landfill sites should include knowledge of the mechanism of fill decomposition, the hydrologic cycle, geology, and ecological balances. Pollution of groundwater by leachate is probably the most important problem; the significant pollutants are usually biochemical oxygen demand, chemical oxygen demand, chloride, and nitrate. Site topography and soil conditions may cause erosion problems. Air pollution, control of disease vectors, possible disturbance of the ecological balance, noise, odors, and appearances must all be considered. Site selection should include evaluation of the type, elevation, and quality of the soil and rock; water levels; ground-and surface- water systems; and local occurrences and uses of water resources. Excellent sites should provide natural protection against pollution: thick deposits of relatively impermeable materials under the site, adequate quantity and quality of cover material, and favorable topographic, hydrologic and climatological features. Avaliable information about these factors should be reviewed, then borings made at the site to confirm these conditions. Piezometers should be installed during drilling operations to monitor water quality and flow conditions. (Buchanan-Davidson--Wisconsin)

OPTIMAL PLANNING OF REGIONAL WAS WATER SYSTEMS AND THEIR IMPACTS STREAM QUALITY WITH A CASE STUDY THE CARSON RIVER BASIN,
Nevada Univ., Reno. Dept. of Civil Engineering
R. G. Orcutt, L. D. Bottoroff, and T. D. Chiatovich.
Available from the National Technical Inform tion Service, Springfield, Va 22161, as PB-247 0 $6.75 in paper copy, $2.25 in microfiche. Des Research Institute, Reno, Center for Wa Resources Research, Publication No EN-2, A gust 1975. 148 p, 14 fig, 10 tab, 71 ref, 4 appe OWRT B-061-NEV(1). 14-31-0001-3909.

Descriptors: *Model studies, *Waste water tre ment, *Nevada, *Optimum development pla *Regional analysis, Algorithms, Treatment fac ties, River basin development.
Identifiers: Lake Tahoe, *Carson Ri Basin(Nev).

The problem of wastewater transportation, tre ment, and utilization in the Carson River and L Tahoe Basins served as a basis for the devel

of the methodologies presented. A general stic algorithm for determining near optimal nal wastewater facilities was derived. mic programming was employed for the sub- ization of interlinked wastewater transporta- systems. The diurnal variation of dissolved en due to photosynthesis was modeled. A ssion relationship involvnig nutrients, flow, temperature was used to estimate the mag- e of the photosynthesis component of the el. Possible future population growth patterns e Carson Valley and the Nevada portion of Tahoe were analyzed with the algorithm to mine the near optimal wastewater facilities to them. The impacts of these systems on dis- d oxygen levels in the Carson River were as- d with the simulation model. Sensitivity anal- of significant parameters was performed to ve a better understanding of their sig- nce in achieving a solution to the type of lem under consideration. (Fallon-Nevada) -01524

echnique to remove excess fluorides from king water has been developed in India. The posed method, called the 'Nalgonda hnique', consists of the addition in sequence of um aluminate or lime, bleaching powder and r alum to the fluoride water, followed by floc- tion, sedimentation, and filtration. The hod was investigated under laboratory condi- s and then tested in the field. Such field studies uded experiments in buckets and in drums ch type) as well as in pilot plants (continuous). The technique was seen to be effective in lucing a clear water, with fluoride within per- sible limits. The precise mechanism of fluoride oval was not understood, and it was due her to adsorption nor to coprecipitation. The nique is adaptable to community water sup- s, and the costs for defluoridation of water for viduals or communities is low enough so as to easible. (Kramer-FIRL) 5-01543

PROGRESS WITH THE DECARBONIZATION PROCESSES (FORTSCHRITTE IN DER VERFAHRENSTECHNIK DER ENTCARBONISIERUNG),
R. Flunkert, H. Pietzner, and A. Schiffers.
Vom Wasser, Vol 43, p 467-494, 1974. 20 fig, 2 tab, 10 ref.

Descriptors: *Calcium carbonate, *Water treatment, Potable water, Water softening, Equipment, Efficiency, Industrial water.
Identifiers: *Decarbonization.

Advances in chemical and engineering technology have permitted the optimization of rapid decarbonization reactors. Practical experience with full-scale trials have confirmed the results of laboratory studies. Several interesting solutions, in terms of economics, have been identified. Rapid decarbonization is sometimes difficult to achieve. This has an adverse effect on optimum operation of the processes because of the sludgy characteristics of the precipitated carbonate of calcium. Mineralogic research has shown that the crystalline structure of calcium carbonate is very important. It is concluded that there are limits to large-scale rapid decarbonization. (Orr-FIRL)

THE CONSTANCE DRINKING WATER TREATMENT STATION-MODEL STUDIES AND OPERATING EXPERIENCES (DIE KONSTANZER TRINKWASSERAUFBEREITUNG-MODELLUNTERSUCHUNGEN UND BETRIEBSERFAHRUNGEN),
R. Barth, H. Lehn, and J. Mauz.
Vom Wasser, Vol 43, p 117-125, 1974. 4 fig, 2 tab, 6 ref.

Descriptors: *Water treatment, *Water purification, *Filtration, *Ozone, Filters, Foreign research, Potable water, Water supply, Europe.
Identifiers: Microfilters, Sand filters, Lake of Constance.

A new system for potable water purification was necessitated by the increasing amount of plankton in the depth of 40-50 meters of the Lake of Constance. The system consists of a rotating microfilter, the addition of unpressurized ozone, and a sand filter. The rate of filtration is 10 m/hr. This system was effective in laboratory tests performed from 1964 to 1966 and in a plant situation from 1968. A tissue of steel-threads, containing 230 holes per sq mm, is stretched over the microfilter. The holes form triangles, and within each triangle is a circle with a 23 mm radius. The zooplankton, most of the phytoplankton, and some bacteria are caught by the tissue. Two percent of the purified water is used to rinse the microfilter. This rinsing brings 90% of the raw-mass into the sewage canal. The remaining small plankton and bacteris are oxidized by ozone. The sand filter can be operated for long periods without cleaning. Cleaning uses 3.0% of the purified water and is performed about every six weeks. The small amount of purified water required for rinsing the microfilter and sand filter eliminates a large drain on the water supply. (Orr-FIRL)

EXPERIENCES WITH DRY FILTRATION OF WATER IN THE NORTH GERMAN LOW LAND (ERFAHRUNGEN MIT DER TROCKENFILTRATION VOL WAESSERN DER NORDDEUTSCHEN TIEFEBEBE),
H. W. Braeuer.
Vom Wasser, Vol 43, p 237-245, 1974. 4 fig, 1 ref.

Descriptors: *Filtration, *Water Treatment, *Filters, Water works, Pilot plants, Foreign research, Efficiencies.
Identifiers: *Dry filters, *Germany.

Dry filtration is described and the raw water supply in Northern Germany is characterized. Operating experiences with dry filters used in 7 water works and 14 pilot plants are discussed. The high solids-holding capacity, and the efficient filtration that can be achieved by employing dry filtration is demonstrated. The performance of these filters after backwashing, and the various operational applications are also discussed. (Orr-FIRL)

BIN ACTIVATOR HELPS UPGRADE WATER PURIFICATION OPERATION.
Water and Sewage Works, Vol 122, No 8, p 68, August, 1975. 1 fig.

Descriptors: *Water treatment, *Lime, *Equipment, Automation, Water purification, Mechanical equipment, Installation, Flow.
Identifiers: Vibra Screw Bin Activator.

An automated system designed to discharge pebble lime from storage to a 10 mgd water purification process was installed in 1974 in the Kankakee Water Company's plant in Kankakee, Illinois. The automated system has reduced labor costs, provided additional storage space in the chemical building, and upgraded the general cleanliness of the facility. The system used pebble lime stored in a wide bin, remote from the chemical building. A five foot Vibra Screw Bin Activator was installed on the storage bin to ensure successful operation of the new system and to eliminate bridging and packing. The bin activator is a vibrated bin bottom, replacing the converging bottom of a static bin, therby removing the compacting area. The bin activator is flexibly attached by rubber fitted forged steel hangers and a bolted seal ring assembly to the enlarged opening formed by cutting off the bin bottom. Bin activator vibrations are isolated from the bin itself by the hangers. The ring assembly facilitates installation and eliminates field fitting and welding. An oil-lubricated and cooled Gyrator vibrates the bin activator and the material in the bin, while an intergral vibrated baffle relieves the headload and transfers the vibrations to material far up in the bin. The material in the activator is thrown horizontally toward the discharge outlet, producing a constant flow of material. (Orr-FIRL)

POLYELECTROLYTES FOR POTABLE WATER TREATMENT.
Water Services, Vol 79, p 147-148, April, 1955.

Descriptors: *Polyelectrolytes, *Potable water, *Water treatment, Coagulation, Sludge treatment, Turbidity, Specifications, Sludge, Water quality, Costs.
Identifiers: Monomer acrylamide.

Polyelectrolytes are being used as coagulant aids in treating water for a potable supply. Although polyelectrolytes have not completely replaced inorganic salts as primary coagulants, they have proven effective in removing color and turbidity from natural waters when up to 5 mg/liter of finely divided sodium montmorillonite clay was added to the water first. One of the advantages of using cationic polyelectrolytes as primary coagulants is a reduction in the amount of sludge produced. Another application of polyelectrolytes in the treatment of potable water is conditioning of sludge before dewatering. The addition of polyelectrolytes accelerates the thickening of sludge by sedimentation before final dewatering. Examples are given of the many uses of polyelectrolytes in potable water treatment. The use of polyelectrolytes instead of activated silica has resulted in lower treatment costs and better finished water quality. The toxic monomer acrylamide is used in the manufacture of some polyelectrolytes. These polyelectrolytes must meet the following specifications established by the U.S. Food and Drug Administration, the U.K. Department of

the Environment, and similar agencies in other countries: no batch may contain more than 0.05 percent monomer acrylamide; the amount used must average no more than 0.5 mg/liter and never exceed 1.0 mg/liter; and, an upper limit for the content of monomer acrylamide must be stated by the supplier for every batch. ACTIVATED CARBON FIGHTS BAD TASTE,
C. A. Black, and D. J. Sulick.
Water and Wastes Engineering, Vol 12, No 9, p 70, 72, 74, September, 1975. 3 fig, 2 tab.

Descriptors: *Water treatment, *Activated carbon, *Taste, *Odor, Potable water, Water quality, Filtration, Suspended solids, Organic compounds.
Identifiers: Filtrasorb 200 granular activated carbon.

Granular activated carbon filters have eiliminated taste and odor problems in the potable water supply of Granite City, Illinois. Filtrasorb 200 granular carbon was added to replace the sand in the city's eight filters. The filters were water soaked for one hour and then slowly backwashed to remove carbon fines. After the fines were removed, the backwash rates were increased to 10.5 gpm/sq ft, producing a 40% bed expansion at a minimum water temperature of 35C. The conversion of the sand filters to carbon filters was finished early in February 1971. Daily threshold tests have shown that the activated carbon filters consistently produce an effluent with a threshold odor value of less than one, irrespective of fluctuations in the quality of the raw water supply. Routine analytical tests to determine the exhaustion rate of the carbon show that about one-half of the adsorption capacity of the carbon has been used. Chlorinated hydrocarbons, phenols, pesticides, insedticides, and aromatic compounds are adsorbed by the carbon filters. The filters have also increased the removal of suspended solids while maintaining the filter head loss to a minimum. The lower backwash rate used with the carbon filters as compared to the rate necessary with the sand filters has resulted in a savings of backwash water. (Orr-FIRL)
W76-01553

EXPANDING A 1927 WATER PLANT FOR THE 1970'S,
H. F. Seidel, and J. L. Cleasby.
Public Works, Vol 106, No. 8, p 54-57, August, 1975. 4 fig.

Descriptors: *Water treatment, Hardness(Water), Filtration, Treatment facilities, Construction, Iowa.
Identifiers: Ames(Iowa), Lime-soda ash softening.

The development of the present Ames, Iowa, water treatment plant is discussed. In 1932, construction began on a new softening plant, to replace the small system that had evolved up to that time. A leading expert on softening was consulted and a plant with a two stage softening process, using lime and soda ash in one stage, and recombining sludge as a seeder for the second stage was constructed. In the 1950's, single stage treatment was experimented with to increase hydraulic capacity. In 1962, this single stage plan was implemented. The latest changes were made in 1971. Over the years a highly flexible, responsive modern treatment plant has been developed, with a minimum of gadgetry and automatic controls and thus a minimum of control and equipment maintenance. WHAT'S NEW IN WATER TREATMENT.
V. Fairweather
Civil Engineering--ASCE, Vol 45, No 9, p 69-72, September, 1975. 2 fig, 2 tab.

Descriptors: *Water treatment, *Potable water, *Legislation, *Chlorine, Ozone, Activated carbon, Polymers, Coagulation, Filtration, Costs, Public health, Turbidity, Water quality standards.
Identifiers: Carbon Chloroform Extract, Safe Drinking Water Act, Carcinogens.

Various assessments of existing standards for potable water were reviewed, partially due to the discovery of potential carcinogens in the New Orleans, Louisiana, water. The largest controversy was on the use of chlorine both at the waste water treatment plant and at the water treatment facility, which may combine with trace organics to form the potential cancer-causing compounds. The two alternatives appeared to be the removal of all possible organics or the elimination of chlorine treatment. Removal of organics by ozone or by activated carbon treatment have been considered. Two proposed standards under discussion were the stringent turbidity standard (1.0 TU) and the Carbon Chloroform Extract (CCE) standard (0.7 mg/liter). The CCE test, which reveals the presence of organic compounds absorbed by carbon, has been criticized as being too broad to be meaningful. It is possible for a water supply to have a high CCE and not contain any carcinogens; it also feared that a water supply with low CCE may contain carcinogenic matter. Other issues under discussion included the advantages of polymer use over alum as a coagulant; the advantages and disadvantages of direct filtration; and the recovery and reuse of alum in sludge disposal. With the implementation of the Safe Drinking Water Act last year, costs of public health will be more carefully considered in the meeting of final standards. (Kramer-FIRL)

WATER PURIFICATION DEVICE,
Gartner Research and Development Co., Bartlett, Ill. (assignee)
W. J. Gartner.
U.S. Patent No 3,909,402, 4 p, 2 fig, 7 ref; Official Gazette of the United States Patent Office, Vol 938, No 5, p 2394, September 30, 1975.

Descriptors: *Water treatment, *Patents, *Water purification, *Filtration, *Adsorption, Water pressure, Activated carbon, Ion exchange, Resins, Equipment.

A system is provided in which the water to be purified flows through a vertical, elongated adsorbent-containing cartridge in an upward direction and is forced through the cartridge against the back pressure of a fine filter downstream of the adsorbent to provide a pressure within the adsorbent chamber between about 5 and 20 psig. The granular adsorbent comprises activated carbon for the purification of waters containing gases, or materials causing odors or colors. The granular material is an ion exchange resin, or a mixture of cationic and anionic exchange resins for the demineralization of water. In use, the purification device is placed in upright position near a source of tap water which is controllable with respect to pressure and rate of flow. The tap water source is connected to the inlet by a connection capable of withstanding moderate pressures; and the outlet of the device is arranged to lead to a receptacle for the purified water. ASBESTOS AND CHLORINATED ORGA TOP AWWA DISCUSSIONS,
W. J. Storck.
Water and Wastes Engineering, Vol 12, No 8 28, August, 1975.

Descriptors: *Asbestos, Potable water, * water treatment, *Water treatment, Water su Water reuse, Public health, Chlorination, O wastes, Colorado.
Identifiers: *Chlorinated organics, Denver(C

Discussion of contaminants in waste wate drinking water was presented at the annual ference of the American Water Works As tion. The focus was asbestos in potable wate plies and chlorinated organics in discharge fluents. A water treatment plant has been des to remove asbestos fibers and lower turbid Duluth, Minnesota. The 30 mgd system consi coagulation, flocculation, gravity filtration, water recovery, and sludge storage. The que of chlorinated organics as carcinogenic agent debated, and the need for laboratory res (animal experiments) on the effects of asbestos and chlorine was stressed. Other ference papers focused on reuse of waste The primary example was the Denver, Colo program. The proposed treatment metho Denver's 1.0 mgd demonstration plant consi lime and other chemical coagulants, recar tion, filtration, nitrogen removal by the system and then regeneration using the

process, two stage carbon treatment with between the stages, a demineralization ozonization, and residual disinfection lorine. The importance of the public for this and other proposed projects was d, and it was felt that the public is not opposed to reuse. (Kramer-FIRL)

IENTATION OF A N. P. D. E. S. DATA EMENT SYSTEM,
t School of Industrial Management. e, Ind.
inston.
e from the National Technical Informarmation Service, Springfield, Va 22161 as 12. $4.00 in paper copy, $2.25 in he. Purdue University Water Resources Center, Technical Report No 69, Sep- 1975, 22 p, 4 fig, 17 ref. OWRT A-040-

Descriptors: *Data processing, *Data storage and retrieval, *Monitoring, Computer models, Water quality standards, Indiana, Pollutant identification, Water pollution control, Information exchange, Information retrieval.
Identifiers: *National pollutant discharge elimination system, Generalized Planning system.

This is a case study of the National Pollutant Discharge Elimination System (N. P. D. E. S.) permit monitoring system specifically with the Indiana Stream Pollution Control Board. This system is concerned with the issuance of permits for polluting the state's waterways, as well as monitoring adherence to these permits. Such efforts necessarily (1) involve the collection, storage, and accession to large volumes of data, (2) and the utilization of models and algorithms that provide the needed analyses of the data. The computer-based data management and retrieval system presented releases the user from the tedious task of data management. The information system provides: (1) an organized structure for data storage; (2) report generation capabilities, and (3) simplified methods for selective information retrieval. The system was designed within the framework of the Generalized Planning System (GPLAN) developed at Purdue University. (Wiersma-Purdue)

Descriptors: *Water pollution, Costs, Economics, *Decision making, *Feasibility, *Cost comparisons, *Water quality control, *Behavior, Attitudes, *Wisconsin, *Economic impact, Optimization, Surveys, Pollution abatement.

An important problem is how to achieve water quality control with minimal adverse economic impacts. This would seem to be an economic optimality problem involving two issues: ascertaining the optimum point between water quality and economic output, and devising a strategy for working toward that point. The following analysis focuses on the latter issue. It conceives of the adoption of water pollution abatement measures as an entrepreneurial type of problem in which each firm must ascertain how to adopt such measures into their operations and remain viable. Logically, then, anything which facilitates this entrepreneurial type of activity will hasten water pollution abatement. Alternatively, if this entrepreneurial type of activity fails to take place, attempts to force water pollution controls will merely drive firms out of business, with consequent unemployment and real income loss. Preparatory to designing research projects for ascertaining how to facilitate undertaking water quality controls, it seems desirable to examine the process by which firms undertake activities about which a considerable amount of information already exists. Exporting is useful for this purpose. This preparatory analysis involved in-depth interviews with the managers of ten Wisconsin firms regarding water quality control and their operations. For analogical insights a mailed questionnaire survey regarding export behavior was made of 423 small-sized Wisconsin manufacturing firms. Inferences were drawn for the adoption of water quality control measures, and a basis laid for a definitive study of the subject.

WATER QUALITY MANAGEMENT AND INFORMATION SYSTEMS,
Krannert School of Industrial Administration. Lafayette, Ind.
A. B. Whinston.
Available from the National Technical Information Service Springfield, Va 22161 as PB247-142, $4.50 in paper copy, $2.25 in microfiche. Purdue University Water Resources Research Center Technical Report No 68, September 1975, 63 p, 17 fig, 12 ref. OWRTA-031-IND(1).

Descriptors: *Data processing, *Decision making, *Planning, *Water quality standards, Basic data collections, Data storage and retrieval, Management, Indiana, Water quality control, Information exchange.
Identifiers: Generalized planning system.

A data management system is presented that will aid planners in the implementation of a decision support system which addresses the technical aspects of areawide water quality planning. The basis is the systematic study of the information flows and their relationships to the goals of the water planning group. The study involved a data processing program for the Technical Information Section of the Indiana Stream Control Board. The data required for the system includes (1) an area description, (2) quality goals, (3) point source data, (4) non-point source data, (5) cost information for the various types of treatments, (6) data on land use plans, populations and employment, and (7) design flow of municipal facilities. The study was an application of the GPLAN (Generalized Planning System) developed at Purdue University. The system is capable of supporting data bases and models for a wide variety of planning problems in addition to water quality management. The GPLAN is a valuable planning tool in that it automates the intertacing between data and models, and it offers a non-procedural, English-like interface between the planner and his computerized resources. W. C. Sonzogni, R. W. Reed, and L. T. Crook.
Available from the National Technical Information Service, Springfield, Va 22161 as PB247-088, $4.50 in paper copy, $2.25 in microfiche. Completion Report, 1975, 64 p, 1 fig, 30 tab, 9 ref, 5 append. OWRTX-148(NO 4250) (1).

Descriptors: Surveys, Data collections, Planning, Water resources, Planning, Short term planning, Water pollution control, Water quality, Management, Institutions, *Great Lakes, *Research priorities, Social participation, Attitudes.
Identifiers: *Research needs, Public interest groups, Non-point nutrient sources, Public participation, Public opinion.

A questionnaire was developed in order to survey public interest organizations as to the priority they place on Great Lakes research needs as well as to promote public awareness of research needs. The questionnaire consisted of 14 carefully selected research needs which could be rated according to high, medium, or low priority. Space was left on the questionnaire to add to the printed list any additional research needs that were felt to be important. The questionnaire also asked the respondents to rank their top five research needs for the Great Lakes in the order of their individual priority. Seventy percent of the 149 potential respondents

completed and returned the questionnaire, indicating a relatively high degree of success in involving Great Lakes public interest groups in research issues. The respondents included environmental and civic organizations, local planning organizations, and business, agricultural, and professional organizations. The results of this survey tend to indicate that public interest organizations have a strong interest in several research areas, such as pollution from nonpoint sources and methods of public participation in water resources issues.

A WATER QUALITY CONTROL PLAN FOR THE SAN FRANCISCO BAY BASIN, PART 1.
Public Works, Vol. 105, No 5, P. 80-86, May, 1975, 4 fig, 1 tab.

Descriptors: *Water quality control, *Planning, *Water resources planning, *Water quality standards, *Projections, Watersheds(Basins), River basins, Land use, Management, *California, Bays.
Identifiers: *San Francisco Bay(Calif), Porter-Cologne Act(Calif), Effluent limits.

This is an example of basin-wide management demanded by state and federal funding. Plans had to meet Environmental Protection Agency and California's Porter-Cologne Act requirements and had to delineate water quality objectives to establish waste discharge requirements regionally. This basin system includes 80 separate drainage basins occupying 3465 square miles, the largest seven basins accounting for 58% of the area. Studies included population projections, land use potential, economic development, and water use development. Water demand is anticipated to be 1.5 million acre feet per year by the year 2000 whereas projected resources are 1.75 million acre feet per year by 1984. Quality of water could vary depending on sources of supply and consumption patterns. Water quality objectives, including 20 categories of use, were identified after desirable uses of water were established. 'Objectives' is used here to indicate a formal standard toward which control efforts are directed and include thermal provisions, pH, dissolved oxygen, turbidity, sulfide, coliform organism concentrations, ammonia, chloride, and total dissolved oxygen. Other considerations were levels of biotic growth, detrimental deposits, floatables, color, odor, taste, fish flesh tainting, radioactivity, toxicity, pesticide contributions, livestock watering, and domestic uses. Waste load projections to the year 2000 were generated for point and other sources. In addition EPA requirements were complied with by classifying and ranking basin waters according to severity of pollution so that more adverse conditions could receive priority funding. (See also W76-01594) (Smith-North Carolina)
W76-01593

A WATER QUALITY CONTROL PLAN FOR SAN FRANCISCO BAY BASIN, PART 2.
Public Works, Vol 105, No 6, p 75-80, June, 1975. 2 fig, 1 tab.

Descriptors: *Water quality control, *Planning, *Water resources planning, *Alternative planning, *Water reuse, *Environmental effects, *Wastewater treatment, River basins, Watershed management, Evaluation, *California, Treatment facilities, Bays.
Identifiers: *San Francisco Bay(Calif), Facilities requirements, Effluent limits.

To arrive at a plan for this basin, consideration of a number of planning concepts and basin-wide environmental issues was necessary as well as the development of several planning strategies. Key issues were: (1) the use of advanced treatment versus the use of superior dilution-assimilation to low risk zones; (2) regional vs. local treatment facilities; (3) reuse of wastewaters for agricultural and industrial uses, groundwater recharge and streamflow augmentation; and (4) flexibility in timing and placement of facilities to be determined by population growth. Five planning strategies were selected for analysis as follows: (1) the existing plan, a subregional composite; (2) limited consolidation of existing facilities; (3) consolidation of facilities toward areas of potential wastewater reuse or land application with discharge of plan effluc receiving waters in those areas. (4) region solidation of facilitie. with discharge awa sensitive areas. (5) regional consolidatio discharge to areas of greatest assimilative ty. It was concluded that continued dischar San Francisco Bay with upgrading of tre was best. The degree of regionalization of t strategy (the existing plan) was deemed terms of probable environmental enhan and long-term reliability, though this m more expensive than other alternatives. T includes a description of necessary was facilities, non-point control measures, an tional control actions necessary for imple tion. The plan was thought to be superior b it intrudes less into environmentally s areas than other alternatives though some impacts are likely. (See also W76-01593) North Carolina)

HENRY GEORGE, PROPERTY RIGHT ENVIRONMENTAL QUALITY: CLAS ANSWERS TO 'NEW' PROBLEMS,
Clemson Univ., S.C.
B. Yandle, and A. H. Barnett.
American Journal of Economics and So Vol 33, No 4, p 393-400, 1974. 27 ref.

Descriptors: *Water quality, *Water *Resources allocation, *Welfare(Econ Aesthetics, Pollution taxes(Charges), value, Ethics.
Identifiers: *Usufructure, *Property rights

Henry George's theory of property right plied to environmental quality, and particu water quality and its allocation. In order to a resource efficiently it is only necessary t tain characteristics of the resource be assig system of property rights, specifically in stance, the usufructure. Following this ide tion water quality can then be allocated as for charges for use, both by consumers an ters, as suggested and detailed by J. H. Da sentially, the use of the natural resource c distributed optimally among competing us all monopoly rent held by existing appropri water quality would be extracted. The eth plication that resources are a part of wealth--that each member of society has s herent claim to them, carries with it a spe plication when allocative systems for dist those resources are considered. If a grou vironmental quality consumers were asked mit their bids for marginal units of water and if they were told that each would pay quality obtained and be reimbursed for which they were outbid, the bids would te honest and the resource would tend to be a efficiently. APPLICATION OF MULTIGOAL QUALITY PLANNING MODEL,
Krannert Graduate School of Industrial A tration, Lafayette, Ind.
D. E. Pingry, and A. B. Whinston.
Journal of the Environmental D Proceedings of American Society of C

ers, Vol 100, No EE1, p 61-75, 1974. 7 tab, 8

criptors: *Water pollution control, *Model stu-
, *Multiple purpose, Planning, Decision mak-
Indiana, Dissolved oxygen, Thermal pollu-
Algorithms, Resource allocation, Optimiza-
Linear programming.
tifiers: West Fork White River(Ind).

nceptual framework for applying optimization
lation techniques in water pollution manage-
t in a river basin is presented. The model is
d on four different sets of dissolved oxygen
ity goals and their annual costs for the West
River, Indiana, and an additional goal in
cing thermal effluents, both relatively inde-
lent in this river application, i.e., if the thermal
ution problem was rejected and the least cost
tion of the BOD problem was determined, the
ctures built and the treatment levels deter-
ed would be the same costs as those in reduc-
hermal pollution. The goals were chosen to il-
ate the possible economies which might be ob-
ed by moderating quality goals downstream
a major pollution source and stiffening the
ity goals upstream. The model provides infor-
on on externalities to be considered in this
urce allocation as applicable to affected con-
ing interests. The planning process would con-
e until an 'acceptable allocation' is reached.
speed of convergence to a solution would be
endent on the type of decision rule used. This
oach indicates that the possibility exists for
mous quality gains at much lower cost than
ld be incurred under treatment at the source
imposition of uniform standards. (Auen-
consin)

ATIONALE FOR A CORPORATE AIR POL-
ION ABATEMENT POLICY,
fornia Univ., Riverside.
. Ferrar.
erican Journal of Economics and Sociology,
33, No 3, p 233-236, 1974. 4 ref.

criptors: *Pollution abatement, *Air pollution,
lustries, *Social aspects, Return(Monetary),
nomic justification, Labor supply.
tifiers: Corporate support.

tionale for corporate support of regional air
ution abatement is offered based on the basic
it incentive. It is propounded that air pollution
rol expenditures will accrue over future
ods in a fashion difficult to quantify, but sig-
ant. The specific social policy of air pollution
rol is examined with the view of eoconomic
fication through a simple theoretical construc-
manifesting an air-quality related labor market
ping that imposes a real cost burden on the
ness sector. Because a business community
not function by labor quantity alone, but
ires a technically specialized mix undesirable
quality would induce the more educated, spe-
zed labor force to leave the area. Thus it
ld be the qualitative warping of the regional
r supply in response to air quality deteriora-
that would impose a real impact on the cor-
te return. (Auen-Wisconsin)

E ECONOMICS OF THE WEST COAST OIL
L CLEAN-UP INDUSTRY,
al Postgraduate School, Monterey, Calif.
. Stone.
ilable from the National Technical Informa-
Service, Springfield, Va 22161, as AD-A-003
$4.50 in paper copy, $2.25 in microfiche. MS thesis, December 1974. 78 p, 5 fig, 6 tab, 14 ref, 2 append.

Descriptors: *Oil spills, *Industries, *Water pollution control, Pacific Coast region, Pollution abatement, Return(Monetary), Financial feasibility, Risks, Fluctuations, Elasticity of demand.
Identifiers: *Oil spills clean-up industry, Seattle(Wash), Portland(Ore), San Francisco Bay(Calif), Los Angeles(Calif), Long Beach(Calif), San Diego(Calif).

The effects of the great fluctuations in demand for commerical firms in oil spill clean-up on the West Coast as related to their return on investment and profits; that industry's viability as affected by clean-up service provided by the private sector, the non-profit cooperative sector, and the government sector; and the overlap of the various sectors is discussed. The interaction of equipment and personnel of the complimentary sectors strengthen the need for each sector of the industry. Commerical firms have concentrated their clean-up capability towards minor spills due to the high cost of large-scale equipment required on moderate and major spills, but they contribute to large-scale clean-up incidents within limits of their capability. The impact of demand uncertainty for the commerical firms is mitigated by the extent of their dependence on clean-up activity as a source of revenue or whether the firm is oriented to other services. The study indicated a trend for increased dependence on other than clean-up activities (marine-industrial cleaning services, tug and barge service, and pollution prevention) by most of these firms. The nine firms investigated shared a 2.4 million dollar per year industry but the uncertain nature of clean-up prevents any prediction of potential growth. (Auen-Wisconsin)

STATE OF THE ART--ACID MINE DRAINAGE CONTROL,
Consolidated Coal Co., Library, Pa.
J. L. Lombardo.
Presented at the American Mining Congress Convention, September 9-12, 1973. Denver, Colo. 25 p, 7 fig, 6 tab.

Descriptors: *Acid mine water, *Mine drainage, *Treatment, *Control, Lime, Treatment facilities, West Virginia, Ohio, Pennsylvania, Sludge disposal, Costs, Gypsum, Fouling, *Reviews.
Identifiers: Consolidated Coal Co Library(Pa), Case studies.

Most active mine discharges are alkaline, containing little or no iron; some are alkaline or nearly alkaline and contain iron. True acid mine drainage has low pH and contains large amounts of iron and other metals. The last two types require treatment and lime is the method of choice. Three Consolidated Coal Company treatment plants are described. Water at the Mingo Plant is mildly acid, at the McMurray Plant it is less acid, has a higher iron level, and contains bicarbonates which could cause sludge settling problems; and at the Whetstone plant water quality is poor with large amounts of acidity, iron, aluminum, and sulfates. Total treatment costs vary from $150,000-200,000/year. Major cost items are lime ($12,000-64,000/year) and capital recovery ($22,000-29.000/year). Costs per 1000 gal are 30 cents at Mingo, 13 cents at McMurray, and 72 cents at Whetstone. The problem of poor settling after aeration was solved by eliminating aeration and making the pH higher to remove iron as ferrous hydroxide. Yearly cleaning of sludge settling zones is provided. Removal of sulfate as the precipitates of calcium sulfate or gypsum improves water quality but increases maintenance and equipment costs and reduces plant design options. (Buchanan-Davidson--Wisconsin)

INTERCEPTING TRENCH AT A LANDFILL RENDERS LEACHATE INTO DRINKABLE SOURCE OF WATER,
South Dakota State Univ., Brookings. Dept. of Civil Engineering.
J. R. Anderson, and J. N. Dornbush.
Solid Wastes Management/RRJ, Vol 15, No 1, p 60-62, 64, 66 and 68, 1975. 1 fig, 1 tab.

Descriptors: *Water pollution, *Quarries, *Landfills, *Groundwater, Garbage dumps, Public health, Trenches, Leachate, Potable water, South Dakota, Ponds, On-site tests, Interception, Water pollution control, Waste dilution, Alteration of flow, Burning.
Identifiers: *Brookings(SD).

Groundwater quality as affected by a refuse landfill in a gravel pit that penetrates a high water table was studied at Brookings, South Dakota. Groundwater showed an increase in dissolved minerals. An algae-laden pond downstream received groundwater from the fill area and helped reduce hardness and alkalinity during the summer. Degraded water was confined to a zone paralleling the direction of groundwater flow where specific conductance and total hardness were twice that of native water; sodium and chloride concentrations were increased 6- and 15-fold, respectively; only manganese was higher than the recommended limit for drinking water. Water quality improved downstream sufficiently for use as a domestic water supply or irrigation. A trench built downstream to the water table slope intercepted degraded water and treated it by dispersion, dilution, or algal photosynthesis, causing organic groundwater contaminants near the fill to decrease. Refuse should not be deposited in open ponds or places that will be immersed when the groundwater table rises. Burning should be avoided. Excellent drainage should prevent infiltration from reaching the refuse. Using tighter soils for the final earth layer and compaction would reduce leaching. (Buchanan-Davidson--Wisconsin)
W76-01627

CASE HISTORY ON ACID MINE DRAINAGE CONTROL,
Bethlehem Steel Corp., Pa.
F. M. Temmel.
Presented at the American Mining Congress Convention, September 9-12, 1973. 29 p, 10 fig, 1 tab.

Descriptors: *Acid mine water, Treatment, Technology, Acidic water, Lime, Neutralization, Underground waste disposal, Treatment facilities, Pennsylvania, Sludge disposal, Pilot plants, Costs.
Identifiers: Case studies, High-Density Sludge Process, Settled solids.

Methods for treating acidic waste waters from coal-mining operations and from steel plants were evaluated. Lime neutralization and assimilation in a coal-cleaning circuit was used to treat acid mine drainage from a high-volatile coal seam but not from a low-volatile coal seam. Dewatering of sludge is a critical limitation. A modified lime neutralization process produced high-density sludge. Depending on mine-water iron oxidation state, sludges contained 15-40% solids. Higher sludge concentrations make filtering or contrifugation possible. When the total iron ferrous content was above 70%, sludge density increased. With both ferrous and ferric wastewaters, the optimum range of the ratio of recirculated solids to solids precipitated from acid mine-water by neutralization was 25:1 to 30:1. Optimum pH was 7.2-7.7. A one minute detention time produced maximum density sludges; ten minutes ensured ferrous iron oxidation and precipitation at pHs above 7.2. Mine-water aeration before neutralization reduced lime demand. Underground sludge disposal induced further dewatering. The High-Density Sludge Process was effective for acid mine drainage treatment and was applied to mine-water discharges at the Bethlehem Mines Cambria Divi-

sion to treat 3 mgd acid rinsewaters from continuous stripndescaling lines. Plans are being made to treat 2 mgd acid wastewater from a wire-mill descaling operation by this method. (Buchanan-Davidson--Wisconsin)

SOME NEW APPROACHES TO SOLVING URGENT PROBLEMS IN THE THEORY AND PRACTICE OF HYGIENIC STANDARDS FOR INJURIOUS SUBSTANCES ,
M. A. Pinigin.
Available from the National Technical Information Service, Springfield. Va 22161 as PB220-229, $3.50 in paper copy, $2.25 in microfiche. National Institutes of Health Translation. NIH-73-235, May 1973. 6 fig, 29 ref, Translated from Vestnik Akademii Meditsinskikh Nauk SSSR, Vol 27, No 1, p 82-86, 1972.

Descriptors: *Air pollution effects, *Chemicals, *Epidemiology, Standards, Lethal limit, Absorption, Public health.
Identifiers: *Toxicology, USSR, Permissible uptake.

Laboratory tests were conducted on white rats to determine the toxicity of inhalation of chemical substances, dependent on dose-time, as a basis for developing standards of chemical emissions in the USSR as well as evaluation of intermittent effects of chemical pollutants in the environment, which fluctuate considerably over time. The determination of permissible concentrations were also based on biological modification of absorbed chemical pollutants. The experimental data showed that during uniterrupted inhalation the time of the onset of certain toxic effects in animals increases with reduction of the concentration of the substance. The concentration-time dependency curves have a characteristic form for each substance. Acute toxicity curves are shown for inhalation of benzine, benzene, styrene, and acrolein. Certain physiological and biochemical shifts have likewise been obtained showing characteristic curves of the concentration-time dependency. A graphic expression for the 'concentration-time' dependence would permit the development of a quick method for the average-day permissible amounts of atmospheric contaminants. Nomograms can be constructed to indicate physiological and biochemical shifts which may be significant in evaluating the intermittent effect as well as for developing standards for industrial and atmospheric pollutants. This research may also contribute to the theory of medical toxicology. (Auen-Wisconsin)

A CURRICULUM ACTIVATIES GUIDE TO WATER POLLUTION AND ENVIRONMENTAL STUDIES, APPENDICES, VOLUME 2.
Environmental Protection Agency, Washington, D.C. Training Grants Branch.
For sale by the Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402 Price $2.25. 1972. 252 p, 9 fig, 15 tab, 15 plates, 33 ref.

Descriptors: *Education, Water, *Training, *Environment, *Water pollution, On-site investigations, On-site tests, Water sampling, Sampling, Analytical techniques, Water analysis, Analysis, Laboratory tests, Chemistry, Biology, Water chemistry, Aquatic life, Aquatic environment, Bacteria, Ecology.
Identifiers: Curriculum activities guide.

Intended as a reference aid for teachers using the Curriculum Activities Guide, the appendixes provided technical information on water sampling, aquatic life, and other field investigations appropriate for students in an environmental studies course. Chemistry, bacteriology, aquatic biology, and engineering and physics were the general area covered. Basic chemical parameters of water were discussed, and testing procedures were described. Instructions for doing bacterial counts were given. Drawings were provided in a key to types of plankton and other aquatic organisms. Field methods for taking biological samples and laboratory techniques for their analysis were described. A simple flow chart explained how to interpret biological data. Mapping, flow measurement, and computer use were described in relation to water surveys. A list of references sources useful to students through the 12th grade level was given, including books, movies, periodicals, and equipment. A glossary covered basic terms on water properties, water pollution, water resources and aquatic ecosystems. (Robinson-ISWS)

RECOVERY OF OIL AND OIL-SOLUBLE CONTAMINANTS FROM THE SURFACE OF WATER,
R. G. Hoegberg, and W. S. Tyler.
U.S. Patnet No. 3,905,902, 5 p, 3 fig, 5 ref; Official Gazette of the United States Patent Office, Vol 938, No 3, p 1234, September 16, 1975.

Descriptors: *Patents, *Oil pollution, *Oil slicks, *Water pollution control, Water pollution treatment, *Water quality control, Skimming, Equipment, Electric fields, *Separation techniques.
Identifiers: Negative electrostatic charges, Discs.

A method of recovering oil or oil-soluble contaminants from the surface of water while minimizing the simultaneous pickup of water consists of partially immersing in the water a number of discs of hydrophobic dielectric polymer which are electrostatically isolated from grounded conductors in contact with the water. The discs are rotated so that the rim portion of the discs is moved through the water to pick up oil or oil-soluble contaminants floating on the water. The discs are frictionally wiped to remove all of the picked up material from the area of contact. The frictional wiping contact and the speed of rotation of the discs triboelectrically establishes and the electrostatic isolation maintains a negative electrostatic charge on each of the discs. BELT DEVICE FOR COLLECTING FLOATI MATTER FROM WATER SURFACE,
Bridgestone Tire Co. Ltd., Tokyo (Jap (assignee)
K. Aramaki, H. Kawakami, and M. Suzuki
U.S. Patent No 3,907,685, 5 p, 15 fig, 9 ref; C cial Gazette of the United States Patent Off Vol 938, No 4, p 1839, September 23, 1975.

Descriptors: *Patents, *Water pollution treatm *Water pollution control, *Oil pollution, Oil sp Flotsam, Jetsam, Skimming, Equipment.
Identifiers: Endless belt.

The invention is a belt device for collecting fl ing matter from water surface comprising a pa pulleys, one of which is arranged above the w surface and the other pulley arranged below water surface, and an endless belt loosely enga with the pulleys and having a lower loosening tion inclined from a relative direction of w flow by an acute angle. The circumferential le of the endless belt is so long that the belt loo engages with the pair of pulleys. The circ ferential speed of the pulley arranged above water surface is made large as compared with of the pulley arranged below the water surf The lower loosening portion of the belt is jected to buoyancy below the surface of the w and pushed by the water flow directed toward belt so that the part of the belt positioned nea water surface becomes inclined from the w surface by a smaller angle. As a result, the lo loosening portion is liable to get intimate with surface of the layer-like floating matter smoothly pull the floating matter into the w without difficulty and further flexibly adapt waves or strong water flow directed toward belt, so that excessive collision and interferenc the belt is not caused, and the floating matter be accurately collected. (Sinha-OEIS)

DEVICE FOR DAMPING THE SURGE WATER WAVES PARTICULARLY FOR FLOATING BODY DESIGNED TO CLEAN P LUTED WATER,
J. Rafael.
U.S. Patent No 3,909,417, 3 p, 3 fig, 7 ref; Off Gazette of the United States Patent Office, 938, No 5, p 2399, September 30, 1975.

Descriptors: *Patents, *Water pollution con *Pollution abatement, *Oil pollution, *Oil sp *Waves(Water), *Surges, Retardance, Bo Ships, Equipment.
Identifiers: Dampening.

In order to efficiently remove the oil floating water surface, it is necessary to peel off only a tain thickness of the polluted water surface an guide it into the cleaning ship. In this inventi device is described in which oil-polluted wate be cleaned even when the sea is aroused and surge is relatively strong. A device for dampin surge of water waves is designed for use cleaning ship or other floating body and pivotable body furnished with a fin which ca immersed either partly or fully in the water whose oscillating motions caused by the w waves are damped. The damping action can b creased when the longitudinal section of the has the shape of a damped sinusoidal wave. Th achieved in that the fin damps the oncoming w with as little shock as possible. The damping b may be attached to the front of a cleaning ship can be folded back in the deck. The oncom waves are damped and the oil-covered sur layer is guided into the inlet opening of the cl ing ship. The device may be made of m plastics or inflatable rubber fabric. (Sinha-OEI W76-01731

NTENANCE OF WATER QUALITY,
lin.
eyor, Vol 146, No 4344, p 7-8, September,

riptors: *Water quality control, Standards,
er pollution control, Reservoirs, Water
y, Monitoring, Waste water treatment,
lation, Chemical wastes, *Water quality
ards.

nain topics of a symposium held by the In-
ion of Water Engineers and Scientists are
wed. Protective measures for three water
es were first considered. Reservoirs are now
accessible to the public, and new means of
cting them must be found to avoid a higher
f pollution. The bulk of pollutants must be
led from river sources, and the remaining
n treated. The establishment of the river in-
monitoring, and storing, as well as an effi-
liaison system are essential for maximum
ction. Groundwater sources should be pro-
l to avoid potential areas of pollution, and
ngs, agriculture and industry should also be
ully planned. Discussion of the control of ef-
ts dealt with the legislative aspects of pollu-
control and with the problems involved in
nting water standards. The need was ex-
ed to reevaluate the bases for the application
fluent standards and to produce more effec-
creening of new chemicals involved in indus-
processes. Also discussed were the criteria
ng raw water and the means of monitoring it.
types of emergencies were listed and emer-
handling procedures based on a coordinated
gement structure with efficient communica-
were proposed. (Waltner-FIRL)

FACILITIES PLANS: CLEARING UP THE CONFUSION,
K. Kirk.
Journal Water Pollution Control Federation, Vol 47, No 8, p 2015-2018, August, 1975.

Descriptors: *Legislation, *Federal jurisdiction, *State jurisdiction, *Planning, Federal Water Pollution Control Act, Water pollution sources, Water pollution control, Water quality control, Administration, Regulation, Municipal water, Storm water, Water resources development.
Identifiers: Nonpoint pollution sources.

Section 208 of the Federal Water Pollution Control Act, which relates to planning activity at the state level, is discussed. In particular, Section 208(a)(6) states, 'The state shall act as the planning agency for all portions of such state which are not designated'. While it has been argued that existing basin planning is not adequate to accomplish control of nonpoint source pollution, it was also stressed that no water quality planning should be carried out for area in which problems do not exist or will not develop the 20-year planning period. Revised regulations published on July 16, 1975, are more specific as to the scope of state planning in nondesignated areas and define the state water quality management plan as a 'management document'. Initial plans must be completed and submitted to the EPA regional administrator by July 1, 1978, and adopted by July 1, 1979. Plans must assess nonpoint source problems and needs; contain a statewide antidegradation policy and methodology for its implementation; forecast both municipal and industrial facilities needs for a 20-year period; define urban and industrial storm water system needs; provide operating and implementing agencies; and analyze the various impacts of the plan. No decision has yet been made as to whether to use Section 208 funds or some other source for the state planning programs, and while regulations specify July 1979 as a plan adoption deadline, NRDC is urging November 1977 as the key date. (Kramer-FIRL)

EPA MONEY PROPOSALS CAUSE CONCERN,
Passiac Valley Sewerage Commission, Newark, N.J.
S. A. Lubetkin.
Water and Wastes Engineering, Vol 12, No 8, p 43-44, August, 1975.

Descriptors: *Legislation, *Federal Water Pollution Control Act, Costs, Federal jurisdiction, State jurisdiction, Construction costs, Water quality standards, Treatment facilities, Waste water treatment.
Identifiers: Federal funding, Construction grants.

Five administration proposals to amend the Federal Water Pollution Control Act Amendments of 1972, which were suggested in May 1975, are evaluated. Topics were: reduction of the federal share of project costs; limitations of federal funding of reserve capacity to service projected growth; restriction of the types of projects eligible for grant assistance; extension of the 1977 date for publically owned treatment works to meet water quality standards; and delegation of a greater portion of the management construction grants program to the states. It was argued that even if the federal share of project costs is lowered from 75% to 55%, these figures are for construction costs only, and the operation and maintenance costs will continue to be paid by the municipalities. Secondly, some flexibility must be maintained if funding of prospective growth is limited. If the types of projects eligible for grant assistance are restructed, it is suspected that this will not encourage state or local self-sufficiency. However, high priority items on both the federal and local levels should be financed first. It was strongly suggested that construction grant management programs should be delegated to a state if and only if the state has demonstrated its ability to handle it. It was also recommended that, in terms of the 1977 deadline for water quality standards, the Administrator must grand compliance schedule extensions on an ad hoc basis, upon the availability of Federal funds and upon time required to build the necessary facilities. In summary, treatment and disposal facilities should be reviewed on an individual basis, allowing cost-benefit analyses, and the municipalities should decide what is equitable. (Kramer-FIRL)
W76-01783

CLEAN WATER WILL COST $159 BILLION.
Engineering News Record, Vol 195, No 12, p 40, September 18, 1975.

Descriptors: *Waste water treatment, *Capital costs, *Operating costs, *Sewers, *Sewage treatment, *Overflow, Infiltration, Construction materials, Sludge, Biochemical oxygen demand, Water pollution control, Analytical techniques.

Results of a study by the National Commission on Water Quality on the costs of providing municipal sewage treatment at the government's standards for 1983 'best available technology' are reported. The total spending necessary is about 159 billion dollars. Of this, $79.6 billion will be used for correction of combined sewer overflows, 80% of that for construction of new storage facilities. Secondary treatment to meet the 1977 'best practicable technology' standards will cost $10.8 billion; advanced waste water treatment, $24.8 billion; rehabilitation of existing sewer systems, $9.5 billion; infiltration control, $6.9 billion; new collectors, $13 billion; and new interceptors, $13.5 billion. Expenditures are also detailed for publically owned treatment works for construction materials and collection systems. The construction time is estimated, and the majority of this will be used for improving the combined sewer overflows. With the new investment, a 60% decline in BOD and suspended solids removal is projected, as well as an increase in sludge production to a level of 14.4 million tons of sludge on a dry solids basis, because the volume of waste water will grow considerably. The decision to meet the 1977 and 1983 goals is dependent upon the condition of municipal finances and actions. (Kramer-FIRL)

EPA COMPLETES NEW PLANT AND SEWER INDEX DATA SERIES.
Engineering News Record, Vol 195, No 12, p 114, September 18, 1975. 3 tab.

Descriptors: Analytical techniques, *Sewers, *Costs, *Construction, Labor, Data collections, Water pollution control, Concrete, Municipal wastes, *Treatment facilities, Waste water treatment.
Identifiers: Sewer indexes, Cost indexes.

The latest Environmental Protection Agency's urban sewer system cost indexes were published and complete the set of cost data for water pollution control construction. Data are presented for 25 cities in each of three categories: 5 mgd municipal waste water treatment facilities; 50 mgd municipal waste water treatment facilities; and complete urban sewer systems. All three indexes' United States averages rose slightly in the third quarter of 1975. The new complete urban sewer system indexes were based on factors including: under labor, common labor, cement finisher, carpenter, and medium equipment operator. Labor rates included fringe benefits. Materials were concrete of the 300 psi ready-mix type, pipe of reinforced concrete, 24 inches, paving asphalt in tank cars, and lowest grade lumber (2 x 10 S4S). Needs for both old and new indexes were measured by the EPA from the results of a questionnaire given to over 100 public and private

recipients of index data. Of 98 responses, 42 expressed a need for the continuation of the old indexes. The latest United States averages for the old indexes, corrected back to June, 1974, are also presented. (Kramer-FIRL)

Water and Wastes Engineering, Vol 12, No 8, p 14-18, 20, 22, 24, August, 1975.

Descriptors: *Legislation, Effluents, Water treatment, Waste water treatment, Regulation, *Federal jurisdiction, State jurisdiction, *Water quality control, Public health.
Identifiers: *Safe Drinking Water Act, Cost-effectiveness.

A critical review of the new safe drinking water legislation, PL 93-523, is presented. Four areas of controversy at the American Water Works Association annual conference were the chlorine/carcinogen controversy, effluent guidelines for water treatment plant waste disposal, waste water reuse for potable water and the impact of this Act. Speaking for the EPA, John Quarles argued that the methods of achieving goals for better water quality would be more flexible and realistic than those of PL92-500. Negative reactions to the Act were expressed by some state representatives, who felt that the Federal Government will have too rigid control over areas that have been under state jurisdiction. Specific criticisms of the Safe Drinking Water Act included: the chlorine residuals portion of the Act should be amended to allow for a level of 1.0 mg/liter in the distribution system; more emphasis should be placed on corrective action, rather than reporting violations and taking samples; turbidity should not be a primary standard because that action disregards regional differences; not enough stress has been placed on inspection of systems and correction of marginal conditions; and various funding aspects are poor and the individual customers are expected to pay for increased services 'whether or not they want these services.' Overall, there is a basic difference in philosophy between the EPA and the states as to whether a water quality control program should be directed towards protection of health or towards being cost-effective. GOVERNMENT DOLLARS TO FUEL 18% GROWTH IN 1976 SEWERAGE MARKET.
Engineering News Record, Vol 195, No 13, p 10-11, October 2, 1975. 2 tab.

Descriptors: *Construction, *Sewerage, *Waste water treatment, *Treatment facilities, Tertiary treatment, Legislation, Government supports.
Identifiers: Sewerage construction.

A survey of 82 major sanitary districts indicated that they plan to spend more than twice the sewerage construction dollars in fiscal 1976 than in the preceding year. Over half the planned spending is for new or expanded treatment plants, comprising about one-third of all United States sewage construction. Earlier this year, $9 billion is impounded pollution control construction funds were released by the federal government, constituting the legislation of a demand for increased sewerage construction. Of the 82 districts reporting, 34 will have $1.9 billion worth of advanced waste water treatment plants under construction by 1979. The greatest growth in fiscal 1976 from 1975 is shown by the Middle West and Middle Atlantic districts. Southern and far western districts plan growth 60% above fiscal 1975; and 11 districts between the Mississippi River and the Rockies have plans to decrease 1976 spending by 24%. A weakness in the project-distribution is that four big cities' fiscal 1976 and 1977 predictions account for 50% of the total reporting districts. These cities--New York City, Chicago, Detroit, and Los Angeles--have $2.8 billion allotted for sewerage construction in 1976 and 1977. With trends towards higher interest rates required to market bonds, problems with municipal funding may injure the market to construction progress in the next year. (Kramer-FIRL)

PENNSYLVANIA USES CREATIVE APPROACH TO WATER QUALITY MANAGEMENT PLANNING,
Pennsylvania Dept. of Environmental Resources, Harrisburg. Environmental Protection and Regulation.
H. Steigman.
Journal of Environmental Health, Vol 38, No 1, p 45-48, July-August, 1975.

Descriptors: *Water quality, *Administration, Water quality control, Water pollution control, *Pennsylvania, *Comprehensive planning.
Identifiers: Comprehensive Water Quality Management Planning Program.

Pennsylvania is designing a Comprehensive Water Quality Management Planning Program (COWAMP) which will focus on technological, environmental, economic, social and management aspects of water quality management. Results should meet the requirements of the Pennsylvania Clean Streams Law and of PL 92-500. Each of the nine study areas that the state has been divided into will have a Coordinator, Consultant, Policy Advisory Committee, a Technical/Study Advisory Committee, a Department of Environmental Resources regional offices and Areawide Planning Organization. COWAMP will include significant local participation and is of an interdisciplinary nature. A notable feature of COWAMP is its consideration of alternative environmental futures; this will consist of an environmental inventory of assets and values present in any given area, followed by the establishment of objectives and policies concerning the said values and assets. Present waste water management services in Pennsylvania are constraining and create financial inequities between neighboring areas. COWAMP's financial designs will be fully incorporated into the physical system alternatives. In this manner, it will be possible to create a financial maintainable system. (Waltner-FIRL)

Identifiers: *Feedlot runoff.

In 1972 the United State Congress enacted t 'Federal Water Pollution Control Act Amer ments of 1972'. This Act required the Environme tal Protection Agency to promulgate efflue guidelines for discharges from feedlots. The guidelines permit discharge from feedlots only connection with an 'unusual rainfall' event. F 1977, the criterion is the 10 year-24 hr storm; 1983, the criterion is the 25 year-24 hr stor These criteria, however, are performance sta dards and do not represent reservoir design. mathematical simulation model was developed size feedlot runoff retention reservoirs based up previous climatological records. Two versions the model were programmed. The first, called t return period design technique, investigated t results of employing EPA's performance sta dards as design criteria. The second model, en tled the sufficient design method, determined t minimum reservoir storage volume required prevent illegal discharge as defined by the El Effluent Guidelines. The two techniques demo strated that to use design procedures based upo factor times the 10 year-24 hour or the 25 year hour storm led to designs that were either u reasonably expensive or which led to illeg discharges for which the livestock producer w subject to monetary penalties.

ntifiers: *Oil spill recovery.

odel test development program was conducted a double weir oil recovery system for rapid overy of oil spilled on the high seas. The tests ducted showed the recovery system to be able of recovering spilled oil at high efficien-s (less than 10% water in the recovered oil) at a gpm flow rate under environmental conditions ging from calm to low State 5 seas (8' signifi-t wave height) and in currents up to 3 knots. system efficiency was relatively independent oil specific gravity, viscosity, oil film thickness, d and wave conditions, oil-water interfacial sion, surface temperatures, and variation in sig-cant oil type when towed at speeds of 1 to 3 ts. Efficiencies of 90-100% can be expected er these conditions. The system effectiveness flow rate) was relatively independent of wind wave conditions, surface temperature, oil cific gravity, oil-water interfacial tension, and nificant oil type variation. The effectiveness of weir/basin unit was not affected by viscosities excess of 100,000 centistrokes, but the oil nsfer system effectiveness dropped below 2000 n for oil viscosities in excess of 2-3000 centis-kes. A detailed discussion of three-dimensional keeping tests, pump and control system tests, -scale model tests with oil, tradeoff studies and tem design drawings were presented. W. Mentz, and J. B. Warg.
vironmental Protection Agency, Report EPA-0/2-75-047, June 1975. 73 p, 12 fig, 9 tab, 8 ref. B040; ROAP 61AAD; Task 016. 68-01-0465.

Descriptors: Water quality, *Coal mines, Cost comparisons, *Water pollution, Mine waters, Ground water, Drainage, *Evaluation, Feasibility studies, Water quality standards.
Identifiers: *Mining methods, Down-dip mines, Up-dip mines.

Detailed results are presented of a feasibility study of down-dip mining, a technique that appears to offer an alternative to sealing or permanent treatment of polluted effluents from coal mines after abandonment. The project included an evaluation of a pair of nearly identical abandoned underground mines - one developed to rise, one developed to dip - to confirm the theory that discharge water quality in down-dip mines is substantially better than that in up-dip mines. An active mine with units operating up-dip and down-dip was also evaluated to ascertain economic and engineering limitations, costs in varying situations, and other major advantages or disadvantages of each mode of operation. Health and safety and National water quality and economic impacts of widespread use versus non-use of the technique were also assessed. (EPA)

Environmental Protection Agency, Report EPA-670/2-75-042, June 1975. 137 p, 33 fig, 27 tab, 4 ref. 1BB041; ROAP 21AVN; Task 033. 68-01-0110.

Descriptors: *Water treatment, *Activated carbon, *Gelation, *Waste water treatment, Biology, Neutralization, Monitoring, Bioassay.
Identifiers: Hazardous materials spill, Hazardous chemical spills, Cyclic colorimeter, Universal gelling agent.

The feasibility of treating, controlling and monitoring spills of hazardous materials was studied. Emphasis was placed on considering techniques and equipment which would be applicable to general classes of chemicals rather than to specific hazardous polluting substances. Several methods were found to be promising for removing or detoxifying spills of hazardous chemicals 'in-situ'. These included: the use of sodium sulfide as a precipitating agent for spills of heavy metal ion solutions; the use of activated carbon packaged in porous fiber bags (carbon 'tea bags') for adsorbing a wide variety of soluble organic chemicals; and the use of various acids or bases to neutralize spills. Methods were studied to control spills on land and prevent their contaminating nearby surface or ground water. A four-component 'universal gelling agent' was developed to immobilize a spilled liquid. A 'cyclic colorimeter', a novel heavy metal ion detector, was perfected and laboratory tested, and a detection kit capable of sensing several chemicals was developed. A computer model was developed and refined to simulate the spread of a spill when certain stream parameters and material characteristics are known. Bioassay studies were conducted for several chemicals using at least three species of biota. In addition, bioassays were conducted to estimate the environmental effect of each of the various treatment methods developed. (EPA)

WATER QUALITY CONTROL IN MINE SPOILS, UPPER COLORADO RIVER BASIN,
Colorado State Univ., Fort Collins.
D. B. McWhorter, R. K. Skogerboe, and G. V. Skogerboe.
Environmental Protection Agency, Report EPA-670/2-75-048, June 1975. 99 p, 13 fig, 10 tab, 20 ref, 7 append. 1BB040; ROAP 21BDU; Task 02. R802621.

Descriptors: Coal mines, *Strip mining, Waste disposal, Drainage, Mine waters, *Water pollution, Water quality, *Groundwater, Water chemistry, Salinity, Soil chemistry, Solubility, Runoff, *Colorado River Basin.
Identifiers: Strip mine wastes, Upper Colorado River Basin.

The purpose was to identify potential water quality problems associated with runoff and percolation through mine spoils at selected sites in the Upper Colorado River Basin. The results show that the production of soluble salts from mine spoils into receiving waters is probably the most significant water quality problem that can be expected. No significant release of heavy metals was observed in the coal mine spoils studied. Some significant heavy metal concentrations were observed in the stream below the tailings disposal area from a copper-lead-zinc mill. A portion of these metals is contributed by the tailings, but a variety of old mines and mine dumps also make a contribution. The quality of percolate and runoff from spoils corresponds to the constituents of extracts prepared from saturated pastes of the spoil material. A method of estimating salt production into receiving waters was derived and found to agree very well with measured salt pickup at one coal site. The minimum quantities of salts that will eventually be released from the spoils studied are estimated. (EPA)

CONTROLLING SULFIDES IN SANITARY SEWERS USING AIR AND OXYGEN,
R. J. Sewell.

Environmental Protection Agency, Report EPA-670/2-75o060, June 1975. 111 p, 27 fig, 22 tab, 56 ref. 1BB043 (ROAP 21ASW, Task 008). 11010 DYO.

Descriptors: *Odor, Corrosion control, Hydrogen sulfide, *Aeration, Oxygen, Sewers.
Identifiers: *Sulfide control, U-tubes, Pressure tanks, Lift stations, *Odor control, Force mains, Diffusers.

Ambient sulfide conditions and corrosion rates in a sanitary sewerage system are described, and results are presented of a study that demonstrated that the use of air or pure oxygen is effective in controlling sulfides. The three techniques used to entrain the gases in the sewage included injection, U-Tubes, and pressure tanks. Sulfide control was evaluated at eight separate locations involving lift stations, force mains, and receiving gravity lines. The entrainment techniques studied were not optimized. However, odor and corrosion problems were abated. Preliminary cost data indicated that air injection into force mains, and the use of air with the U-Tube were the least costly sulfide control measures. (EPA)

AQUATIC HERBICIDES AND THE CONTROL OF WATER WEEDS,
Cambridge Univ. (England). Dept. of Applied Biology.
M. P. Brooker, and R. W. Edwards.
WATER Research, Vol 9, No 1, p 1-15, January 1975. 7 tab, 2 fig, 136 ref.

Descriptors: *Aquatic weed control, *2-4-D, *Dalapon, *Diquat, *Paraquat, *Herbicides, *Food webs, *Biological communities, *Aquatic flora, *Water quality, *Environmental effects, 2-6-dichlorobenil, Aquatic fauna, Toxicity, Dissolved oxygen, Plant growth regulators.
Identifiers: *Maleic hydrazide.

The application of herbicides for the control of aquatic plants produces two groups of effects. The primary or direct effects result from the spectrum of toxic action of the herbicide itself on aquatic and, after abstraction, terrestrial organisms. The secondary or indirect effects result from the death of the plants, and consequent changes in the physical, chemical and biological nature of a treated water body, changes which may interfere with abstracted uses. Such effects are reviewed, particularly where they constrain other water resource uses or differ from effects resulting from cutting and removal. Concerning direct effects, the losses of aquatic herbicides from water and their toxicity to mammals, aquatic fauna and crop plants are considered together with the implications of different methods of herbicide application. Possible methods of removing aquatic herbicides from water supplies are described. The major ecological changes following the use of aquatic herbicides are indirect resulting from the destruction of the aquatic plants. The death and decay of submerged aquatic plants is likely to perturb the oxygen-carbon dioxide balance of the water and other changes in water quality are likely to occur. Loss of habitat and changes in available food resources may result in changes in the aquatic fauna. Replacement growths of plants (macro- or micro) may cause problems in relation to drainage functions, water abstractions and recreational facilities. (Katz)

ANTITRUST AND POLLUTION CONTROL: AN EPA PERSPECTIVE,
Environmental Protection Agency, Washington, D.C. Office of General Counsel.
R. V. Zener.
University of Pittsburgh Law Review, Vol 36, No 3, p 705-714, 1975. 10 p, 30 ref.

Descriptors: *Research and development, *Research facilities, Technology, *Water pollution control, *Air pollution effects, Research priorities, Pollution abatement, Water pollution treatment, Legal aspects, Constraints, Regulation, Penalties(Legal), Water, Water law, Environmental effects, Legislation, Law enforcement.
Identifiers: *Antitrust laws, *Consumers.

There has been considerable discussion concerning the application of antitrust laws to joint research and development for pollution control. A basic premise of the antitrust laws is that competition is the best stimulus for product improvement. Consumers generalyy are willing to absorb the cost of research when it leads to a more efficient product; and industry, in turn, is willing to engage in such research to realize a competitive advantage. The proponents of joint research for pollution control, however, argue that this premise does not apply where the gains from research are largely social. Consequently, they urge, joint research and development may be the only realistic method for the realization of social benefits. Nevertheless, problems would exist if such joint ventures were expected from antitrust regulation. For example, it would be unthinkable to allow companies engaged in development and sale for profit of pollution control equipment to engage in joint research outside the reach of antitrust laws. Another potential problem is that when there is no competitive advantage to the development of innovative technology, a conspiracy to retard development is obviously easier to maintain. Additional arguments, pro and con, are presented concerning whether joint research and development for pollution control should be subject to antitrust laws. (Hoffman-Florida)

WATER QUALITY STANDARDS OF THE 1972 FEDERAL WATER POLLUTION CONTROL ACT: PRODUCTIVE BUT UNREALISTIC,
S. F. Unger.
Gonzaga Law Review, Vol 10, No 1, p 165-180, 1974. 16 p, 89 ref.

Descriptors *Economic feasibility, *Adoption practices, *Federal Water Pollution Control A *Water quality standards, *Industrial wast Regulation, Technology, Effluents, Polit aspects, Economic impact, Economic efficien Tangible benefits, Water pollution treatme Waste treatment, Waste disposal, Econor justification, Water quality, Federal governme Planning, Legislation, Technology.
Identifiers *Effluent limitations, Po sources(Pollution), Funding, *Federal Water P lution Control Act Ammendemnts of 1972.

The emphasis of the Federal Water Pollution C trol Act Amendments of 1972 is primarily on tre ment, by the best technology available, discharges at specific point sources. The Ame ments provide a two step process for the achie ment of the required effluent levels. Phase O requires industries to utilize by 1977 the practi ble control technology currently available. Ph Two extends to 1983 and requires industry eit to achieve no discharge or to utilize the b available technology economically achieval These new standards will require drastic exper tures by some companies since 'best availa technology' refers to the best performing compa in a particular industrial category, while 'b practicable technology' refers to the average the most efficient performers. Barriers to full co pliance with the 1972 Amendments explored h include: (1) high costs; (2) insufficient fede funding for research and construction; (3) indus opposition; and (4) the political effects of Wat gate on the nation's pollution control prograr While the 1972 Amendments will doubtless hav beneficial effect on the nation's waterways, i arguable that the water quality standards requi will create costs far greater than any soc benefits resulting. THE SAFE DRINKING WATER ACT A EPA'S ROLE IN TRAINING,
Environmental Protection Agency, Washingt D.C., Division of Water Supply.
J. H. McDermott.
Journal of the American Water Works Assoc tion. Vol 67, No 8, p 441-42, August, 1975. 2 p illus, 2 ref.

Descriptors: *Potable water, *Trainii *Education, *Scientific personnel, *Public ut ties, Legislation, Public health, Environmen sanitation, Occupations, Personnel, Person management, Water supply development, Wa utilization, Water conservation, Domestic wat Water quality, Water purification, Water pol tion, Governmental interrelations, Economi Costs, Cost allocation, Federal government, St governments.
Identifiers: *Safe Drinking Water Act.

The Safe Drinking Water Act recognizes the siz ble training needs exist for community wat supply systems personnel and that such needs c be met only by a cooperative federal, state, lo effort utilizing the capabilities of both public a private sectors. For example, the 1970 Commun Water Supply Study indicates that 63% of oper ing personnel have no formal training in sanita microbiology and, for systems that provide tre

it other than disinfection, 46% have no formal ning in chemistry. In addition, estimates in- ate that personnel in state water-supply posi- s will have to be increased ten-fold in order to port optimum state programs. The Environ- ital Protection Agency will have primary ponsibility in developing and supporting train- programs. The cost of this training will include ct costs, for providing the programs them- es, and indirect costs, such as the higher sala- that will be needed to attract and retain lified personnel. However, because this train- workload will be so formitable, it is clear that major costs must be borne not by the EPA, but the utility itself as a basic cost of doing busi- s. (Hoffman-Florida)

e Alaska Environmental Conservation Act was acted in 1971 to halt environmental degradation. e purpose of this Comment is to inform askans of the criminal sanctions embodied in the te's environmental control law. A schematic ex- ination of the criminal provisions of the Act eals the types of conduct prescribed by the law. general, the provisions fall into three catego- s; violation of department orders and directives, ecific prohibitions, and the general prohibition tute. Department orders contain provisions for termining when an order may issue, and when it order becomes effective. Specific prohibitions lude regulations promulgated by the depart- nt and statutory prohibitions drafted by the islature. The general prohibition statue consists a single provision which broadly prescribes pol- ion in general and makes polluters strictly liable any violations. Finally, some of the Act's more portant criminal provisions are examined in ht of the recent Alaska Supreme Court case, ock v State in which corporate officials were ld responsible for the drainage of raw sewage o waters reserved for drinking purposes. offman-Florida)

ST CASE ON OCEAN DUMPING: MUST HILADELPHIA MOVE TOWARD ON-LAND SPOSAL OF SEWAGE SLUDGE.
vironmental Law Reporter, Vol 5, No 9, p 144-10147, 1975, 4 p.

escriptors: *Waste disposal, *Pennsylvania, Waste dumps, *Sea water, *Permits, Solid wastes, Waste water disposal, Sludge, Industrial wastes, Organic wastes, Administrative decisions, Administration, Administrative agencies, Law enforcement, Legal aspects, Ultimate disposal, Water pollution control, Legislation, Public health, Environmental effects, Water quality control, Standards.
Identifiers: *Ocean dumping, *Land-based waste disposal, *Philadelphia(Penn).

The Marine Protection, Research, and Sanctuaries Act of 1972 was passed to regulate the dumping of all types of materials into ocean waters and to prevent or restrict the dumping of harmful materials into ocean waters. Discussed here is a statute requiring the design and implementation of land-based waste disposal projects. To help achieve this goal the Administrator of the Environmental Protection Agency (EPA) has the discretion to issue interim permits for ocean dumping to those who have started the sometimes long process of implementing land-based waste disposal. Until recently, the EPA has been lax in enforcing permit requirements. In 1975, however, the EPA ordered Philadelphia to cut all ocean sludge dumping in half by 1979, and to end it completely by 1981. The city has asked that this regional decision be reviewed by the Administrator. The Administrator's ruling, to be delivered in the fall of 1975, should have a significant impact on the future of land based waste disposal projects.

E L I CONCLUDES WATER ACT ENFORCEMENT STUDY.
Environmental Law Reporter, Vol 5, No 9, p 10158-10161, 1975, 4 p.

Descriptors: *Federal Water Pollution Control Act, *Administrative agencies, Law enforcement, *Coordination, *Adjudication procedure, Water law, Water policy, Legal aspects, Penalties(Legal), Water quality control, Decision making, Governmental interrelations, Remedies, Administration, Regulation, Administrative decisions, State governments, Social aspects, Water pollution control, Water management.
Identifiers: Administrative remedies, Judicial remedies.

Law enforcement under the Federal Water Poilution Control Act Amendments of 1972 was the topic of a recent study by the Environmental Law Institute (ELI). This article presents a summary of the Institute's findings and summaries. The study found that pollution control agencies were reluctant to issue warnings and orders and generally preferred to use informal cooperation when dealing with dischargers. While such cooperation was generally beneficial, it was sometimes found to result in inconsistent decisions which often created internal conflict over enforcement policies. The study also found that administrative remedies are generally more productive than judicial remedies in dealing with dischargers. A major advantage of administrative action is that it is quick and inexpensive. In addition, it allows the agency to work with the discharger. Litigation, on the other hand, is time-consuming, expensive, and often provokes a discharger to assume a combative attitude that further delays compliance. A review of inter- and intra-governmental relations found cooperation between the Environmental Protection Agency, United States Attorneys, and the Justice Department to be good. Relations between state water pollution agencies and state attorney generals, however, were frequently found to be poor. (Hoffman-Florida)

A SELECTED ANNOTATED BIBLIOGRAPHY ON THE ANALYSIS OF WATER RESOURCE SYSTEMS, SIXTH VOLUME.
Office of Water Research and Technology, Washington, D.C.
Available from the National Technical Information Service Springfield, Va 22161 as PB247-098, $12.50 in paper copy, $2.25 in microfiche. Water Resources Scientific Information Center, OWRT/WRSIC 75-201, September 1975, 481 p, Edited by Daniel P. Loucks, Cornell University, Ithaca, New York.

Descriptors: *Systems analysis, *Bibliographies, *Water resources, Development, **Optimization, Simulation analysis, Operations research, Abstracts, Planning, Management, Alternative planning.

This is an annotated bibliography consisting of 301 abstracts of selected publications issued in 1973 and 1974 pertaining to the application of systems analysis techniques for defining and evaluating alternative solutions to water resource problems. The first two volumes of this bibliography, having the same title, were published by the Cornell University Water Resources and Marine Sciences Center, Ithaca, New York (Publication 25, August 1969; Publication 35, June 1971); the third, fourth and fifth volumes were published by the Water Resources Scientific Information Center in December 1972, December 1973, and July 1974, respectively. Both subject and author indexes are provided. Descriptors are listed with each abstract. The abstracted material emphasizes the application of optimization and simulation techniques for assisting the planning and management of water resource systems. (See also W75-11574).

TOWARDS SYSTEM MODELS FOR WATER RESOURCE MANAGEMENT--A COMMENT,
Department of the Environment, London (England). Systems Analysis Research Unit.
P. G. O'Neill.
Journal of Environment Management, (U.K.), Vol 2, No 1, p 79-82, 1974. 4 ref.

Descriptors: *Mathematical models, Water resources, Planning, Optimization, Model studies, Decision making, *Reviews.
Identifiers: State-of-the-art, England.

The effectiveness of system models in water resources management is considered. Models seeking minimal operating costs have found some limited use for linear programming formulations, primarily where sources are mainly groundwater. Generally, however, the non-linearity of the physical relations involved has lead researchers to prefer dynamic programming, or hill-climbing methods using simulation of sub-programs. Models have been used to derive the optimal costs relationship, discounting, and evaluating initial underutilization of a system. Dynamic programming has not been of great help in resource management because of the problem of dimensionality but has proved useful in the determination of the optimal combination of effluent-treatment and water-treatment plants along the course of a river and could potentially be used for both waste disposal and public water supply. Systems models can and do offer useful guidance to the implications of alternative philosophies of management, but the real issues in water resource management are political and their resolution requires many interdisciplinary skills. While it is tempting to aim at the optimization of system development and control in terms of maximizing net social welfare even this objective is deterred by the absence of any objective criterion for the distribution as opposed to the allocative implications of a strategy. THE SANTA ANA RIVER BASIN: AN EXAMPLE OF THE USE OF COMPUTER GRAPHICS IN REGIONAL PLAN EVALUATIONS.
Steinitz Rogers Associates, Inc., Cambridge, Mass.
IWR Contract Report 75-3, U.S. Army Engineer Institute for Water Resources, Fort Belvoir, Virginia, June 1975. 290 p, 117 fig, 10 tab, 27 ref.

Descriptors: *Watersheds(Basins), *Planning, *Computer programs, Methodology, Graphical methods, Land use, Evaluation, Effects, Alternative planning, Water resources, Decision making, Forecasting, Regions, Systems analysis.
Identifiers: *Computer graphics, *Upper Santa Ana River basin(Cal), Environmental impact studies, Data bank, Land use patterns, Locational attractiveness models, Matrix models, Weighted indices.

Solutions to most problems of watershed management require large amounts of information regarding natural resources, land use, and social needs. This report explores the possibilities of computer graphics as a tool in the process of watershed planning. Considered is a research project involving a study of the Upper Santa Ana River Basin in California and addressing techniques for predicting future land use patterns, analyzing the effects of future land use on resources, identifying desirable alternative plans for resource development, and applying these methods toward the generation of environmental impact studies, particularly for regional-scale development decisions. The project consisted of the creation of a computerized data bank of site resources and land use elements, the development of locational attractiveness models defined by major activities or land uses occurring in the basin and the identification of the criteria which define land use decisions, the analysis of the vulnerability of various natural systems to impacts caused by future land use change, and the analysis of the attractiveness models and the impact models by evaluating two locally specific land use plans. Weighted indices were used to evaluate land use locations, matrix models to evaluate the resource impacts of land use patterns and computer programming to relate the model information to specific land areas. The GRID computer program (Harvard University, 1968) accomplishes data organization, analysis, and display. (Bell Cornell)

B. W. Taylor, and R. M. North.
Available from the National Technical Information Service, Springfield, Va 22161 as PB247-11 $5.00 in paper copy, $2.25 in microfiche. Georgia Environmental Resources Center, Atlanta, Report No ERC 1375, September 1975, 73 p, 4 fig, 10 tab, 57 ref. OWRT A-052-GA(1). 14-13-31-0001-4010

Descriptors: *Evaluation, *Project feasibility, *Project planning, *Benefits, *Costs, *Risk, *Simulation analysis, Georgia, Estimating, Investment, Monte Carlo method, Cost-benefit ratio.
Identifiers: Spewrell Bluff Project(Geo).

The existing economic criteria for evaluating water resource projects are deterministic and therefore incomplete since these criteria do not include any consideration of uncertainty of possible outcomes. A Monte Carlo simulation approach was used to generate values for a mean and a standard deviation for the benefits, costs, benefit-cost ratios and net present values for the Spewrell Bluff Project in Georgia to demonstrate the variability of probable outcomes from investing public funds in the project. A triangular distribution of most likely, most optimistic, and most pessimistic estimates of project managers within the Corps of Engineers formed the basis for the simulation. Additional estimates were obtained from outside sources for comparative estimates of project variability and as a test for the internal estimates. Comparable measures of expected mean values and variability of outcomes for all projects could lead to better investment decisions and reduce controversy over water resource projects.

PLANNING FOR COASTAL RECREATION OPPORTUNITIES NEAR LARGE URBAN AREAS: A STUDY RELATING TRANSPORTATION AND RECREATION,
INTASA, Menlo Park, Calif.
D. P. Lijesen, Y. Snir, J. Rosing, and K. Skurski.
Available from the National Technical Information Service, Springfield, Va 22161 as PB247-12 $5.50 in paper copy, $2.25 in microfiche. Completion Report, July 1975. 110 p, 15 fig, 18 tab, 23 ref, 2 append. OWRTC-5213(No. 4234)(1).

Descriptors: *Transportation, *Recreation, *Access routes, Recreation demand, Planning, Coasts, Methodology, Competing uses, Water resources development, Planning coordination,

term planning, Estimated benefits, Comve benefits, Comparative costs, Computer l, Pacific coast region, *California, Beaches, nable use, Environmental effects.
fiers: California central coastal zone, Sen- y analysis, Comparative analysis, Recreation ansportation plans, Recreation accessibility l, Public information, Recreation planning rios.

ation research is traditionally either ior-oriented or directed towards methodolo- or economic benefit evaluation of recreation :ts; recreation planning generally produces a nent indicating how, when and where recrea- opportunities are to be provided. General ition research and functional planning are m mutually influential nor do they provide asis for informed decision making by the :. The thrust of this research was to identify pe of information that the recreation planner d develop during the planning process in to formulate plans that include the issues of rn to people who will ultimately accept or re- plan. A sensitivity approach is proposed to op information on level and geographic dis- ion of recreational visitation, a key input ds determining the final implications as- ed with recreation plans. An approach is nted for modeling the accessibility of recrea- esources as a function of demand for activi- upply of opportunities, and the highway net- connecting demand centers and supply . The specific case of planning for coastal ation opportunities along the California Cen- oastal Zone near the San Francisco-Oakland- ose and Fresno metropolitan areas was used monstrate the usefulness of the methodology ictional recreation planning.

LYSIS OF THEORIES AND METHODS ESTIMATING BENEFITS OF PROTECT- URBAN FLOOD PLAINS,
ington Univ., St. Louis, Mo., Inst. for Urban egional Studies.
eenberg, C. L. Leven, and A. Schlottmann.
lable from the National Technical Informa- Service, Springfield, Va 22161 as AD/A-005 $5.50 in paper copy, $2.25 in microfiche. ared for Army Engineer Institute for Water urces, Fort Belvoir, Va. Final report, mber, 1974. 104 p, 5 fig, 7 tab, 23 ref, 3 ap- DAWC-31-74-C-0054.

riptors: *Cost-benefit analysis, *Estimated fits, *Environmental effects, *Regression sis, *Model studies, *Flood plains, *Linear amming, Intangible benefits, Social aspects, arch and development, Land use.
ifiers: Urban flood plains, Land values, ral equilibrium locational model, INTASA l, Weisz model, St. Louis(Mo), Urban stu-

l control projects have been developed based e sole criteria of benefits exceeding costs by determining present value of all benefits and costs, determining the effective life of the project and estimating construction and land value costs. Various complications result, particularly estimating the stream of expected benefits which is the focus of this report. From the theoretical model developed and a review of relevant literature, it was concluded that subject to problems caused by externalities, benefits of flood plain protection can be appropriately measured by direct estimation or by examining changes in site values of affected areas. To develop this general equilibrium locational model, two methodological studies using locational measures, INTASA-and Weisz, are reviewed and the empirical techniques applied to their methodologies are criticized. Having a similar conceptual model which uses changes in land values in the final analysis, both models have serious shortcomings: Misspecification of land value equation, inability to measure social and environmental effects, biased population projections and lack of consideration for alternative land uses. A regression model of the effect of flood risk on land values developed with St. Louis area data seems to deal with some of these problems. Research is necessary to develop techniques and models for determining land values. (Salzman-North Carolina)

WASHINGTON'S WATERFRONT LESSON,
North Carolina Univ. at Chapel Hill. Dept. of Fine Arts.
S. J. Makler.
Water Spectrum, Vol 6, No 4, p 21-28, Winter, 1974-75. 11 fig, 6 ref.

Descriptors: *City planning, *Area redevelopment, *Political aspects, *Social aspects, *Psychological aspects, *District of Columbia, Economic justification.
Identifiers: *Waterfront Renewal Project, Washington channel, National Capital Planning Commission, Washington D.C.

This article examines the urban waterfront renewal project in Washington, D.C., pointing out the need to remove blight with caution before resorting to razing and rebuilding. The opposing banks of the Washington channel reflect two diverse land uses: a wooded peninsula on the east and a modern urban complex complete with restaurants, motels, shops and upper-income residences on the opposite side. Authorized by Congress and the National Planning Commission, developers and a non-profit corporation of prominent local citizens planned to revitalize the west bank which, although not deteriorating had a backwater look which was not good enough to be a showcase for the new Southwest. Political and financial interests prevailed with little consideration to neighborhood merchants and residents. The process of renovating the waterfront began with high ideals and grandiose designs coupled with an unclear concept of what should be done. The project evolved in an atmosphere of confusion and compromise between developers and local residents which restricted alternatives. The renewal seems nothing more than a face-lift at a considerable cost which includes expensive flood control and fewer expected revenues from low-density development. The area is more accessible to the public and tourists, and more organized and new in appearance, yet the color, charm and character of the old waterfront are lost. (Salzman-North Carolina)

THE CONCEPT OF WATER RESOURCES DEVELOPMENT,
Central Water and Power Commission, New Delhi (India).
J. P. Naegamvala.
Indian Journal of Power and River Valley Development, p 6-12, January 1973. 1 tab, 6 ref.

Descriptors: *Water resources development, *Asia, Optimal development plans, Water supply, River basin development, Water storage, Interbasin transfers, Water demand.
Identifiers: *India.

To illustrate the present stage of India's water resources development and to visualize future possibilities, five parameters--the percentage of gross water resources developed, per capita culturable land available, percentage of cultivatable area irrigated, irrigation intensity and per capita water made available are given for each river basin. Based on per capita water made available, irrigation intensity, and percentage of agricultural area irrigated, the Indus basin is the most developed. But in terms of optimum water use, this region has great potential of improving the irrigation efficiency not only of water use and productivity but also to enable diversion to adjoining dry areas in Rajasthan without detrimental effects. The Brahmaputra basin is the most underdeveloped in the country but flood protection overrides other developmental aspects. The Brahamaputra basin waters, when controlled for generation of power and mass trans-basin diversion, will control the destiny of India beyond 2000 A.D. Basin-wide studies of population growth show the urgent need to achieve better water distribution through inter-basin transfers, conjunctive use of surface and groundwaters, etc., with priorities in individual regions. Simultaneously, the need for water conservation by evaporation suppression, better management, and improving supply efficiency for demand-based performance is also indicated. (Auen-Wisconsin)

SALT RIVER PROJECT ANNUAL REPORT, 1974.
Salt River Project, Phoenix, Ariz.
1974, 26 p, 14 fig, 13 tab.

Descriptors: *Water resources, *Electric power production, *Water utilization, *Water management(Applied), *Water resources development, Hydroelectric plants, Power marketing, Electric power costs, Electric power demand, Hydrology, Planning, Water supply, Water allocation(Policy), Water demand, Water requirements, Water distribution(Applied), Arizona, Water delivery, Surface waters.
Identifiers: *Salt River Project, Salt River(Ariz), Verde River(Ariz)

The Salt River Project is comprised of the Salt River Project Agricultrual Improvement and Power District, which provides electric service to residential, commercial, industrial and agricultural power users in a 2,900 sq mile area in parts of Maricopa, Gila, and Pinal counties in Arizona, and the Salt River Valley Water Users' Association, which administers water rights of the Project's 250,000-acre area and operates and maintains the irrigation transmission and distribution system which provides water for agriculture, municipal and industrial uses. For the year 1974, total water demand remained relatively constant, but city demand for water increased from 152,626 acre-ft in 1973 to 160,342 acre-ft in 1974 and the number of electric customers increased from 225,921 to 239,431 from 1973-1974. For 1974, operating revenues totaled $169,585,165 and net revenues reached $8.8 million. Total water use decreased from 895,886 acre-ft in 1973 to 710,723 acre-ft in 1974. (Robinett-Arizona)

ARIZONA ENERGY INVENTORY: A REPORT ON THE STATE'S ENERGY POSITION AND OUTLOOK TO 1985,
Arizona Univ., Tucson. Div of Economic and Business Research.
H. J. Frank.
Arizona State Fuel and Energy Office, February 1975, 108 p, 10 fig, 41 tab, 24 ref, 5 append.

Descriptors: *Electric power production, *Hydroelectric plants, *Planning, *Arizona, *Electric powerplants, Water resources, Water utilization, Water resource development, Electric power demand, Surface waters, Electric power, Thermal powerplants, Hydroelectric power, Pumped storage, Water utilization.
Identifiers: Energy resources.

The contribution which Arizona's energy resources currently make toward meeting the energy requirements of the state is limited to hydroelectric power and coal. Known deposits of crude oil, natural gas, and uranium are scattered and small, and information on these sources, as well as coal, is inadequate. Energy demand projections indicate that consumption in 1985 could be as much as two and one half time the 1973 level if the historical growth trend continues. There are 12 existing hydroelectric generating sites in Arizona which contributed 11 percent of the state's energy in 1973. These 12 dams have a total of 51 generating units, with a total generating capacity of 3010 megawatts of which about 875 megawatts are available to Arizona (this represents 1.5 percent of the total installed hydroelectric capacity in the United States). There are 18 potential sites for new hydroelectric facilities in the state. No estimates are available of the number of units or the total capacity at 10 of the sites, but the remaining 8 sites could be suitable for a total of approximately 40 generating units with a total capacity of over 17,000 megawatts, or five times the capacity of current units. (Robinett-Arizona)

ENERGY DEVELOPMENT IN THE ROCKY MOUNTAIN REGION: GOALS AND CONCERNS.
Federation of Rocky Mountain States, Inc. Denver, Colo.
July, 1975. 134 p, 7 fig, 20 tab, 36 ref.

Descriptors: *Rocky Mountain Region, *Water utilization, *Electric power production, *Environmental effects, *Planning, Arid lands, Electric powerplants, Hydroelectric plants, Water resources, Social aspects, Water requirements, Economics, Legal aspects, Land resources, Water conservation, Administration, Water law.
Identifiers: *Energy development, Regional energy statements.

This report is composed of 3 parts: the first contains 3 regional energy statements; the second is a summary of data currently in use by state, federal and private business officials and attempts to define the region's energy sources and how the development will affect the states in the Rocky Mountain West with respect to water resources, and environmental and social aspects; the third part consists of a group of background documents on energy development issues, and includes papers on economic effects, social problems, balancing resource development with environental protection, state responsibilities, the federal government and industry, legal questions and alternatives, and a review of federal energy research and development policy. Most noncontroversial hydroelectric sites have already been develop[ed] in the West, and those that are underdevelope[d] of great environmental value. Limited [water] resources call for greater care in the locati[on] plants, the selection of extraction, production [and] conversion processes, and the choice of p[ower] transport and waste treatment systems [that] would be required in less arid regions. (Rob[inett]-Arizona)

THE ROCKY MOUNTAIN REGION: A U[RGENT] OF INTERESTS.
Federation of Rocky Mountain States, [Inc.] Denver, Colo.
October, 1975. 128 p, 80 tab, 42 ref.

Descriptors: *Rocky Mountain Region, *Na[tural] resources, *Water resources, *Plan[ning], *Agriculture, Arizona, Colorado, Idaho, Mon[tana], Nevada, New Mexico, Utah, Wyoming, W[ater] conservation, Water utilization, Land resou[rces], Recreation, Water requirements, Arid lands, [Soc]ial aspects, Economics, Transporta[tion], Forestry, Land use, Urbanization.

This publication represents a source of info[rma]tion for the Rocky Mountain Region (incl[uding] Arizona, Colorado, Idaho, Montana, Nev[ada], New Mexico, Utah, and Wyoming), with re[gard] to natural resources, human resources, transp[or]tation, market development, telecommunicat[ions], housing and community development, agricul[ture] and the arts and humanities. The na[tural] resources, water needs and projects, and f[uture] plans of each state are discussed. Statistics in [the] following categories are given for each s[tate]: agriculture, water, energy and minerals, land[use] and ownership, forestry, grazing land, out[door] recreation, and socio-economics. Water need[s] agriculture and municipal use are increasing [while] the region remains the driest area in the U[nited] States. A large percentage of the water iused i[n] irrigation, and if new water needs are not met [the] agricultural industries will suffer first. (Robi[nett]-Arizona)
W76-01712

STAGE 1 DEVELOPMENT OF THE SHO[ALH]AVEN SCHEME-I.
Snowy Mountains Engineering Corp., Co[oma] (Australia).
Water Power and Dam Construction, Vol 27 [No] 8, p 275-282, August, 1975. 4 tab, 9 fig.

Descriptors: *Sewerage, *Water supply, *Ele[ctric] power, Dams, Construction, *Australia.
Identifiers: Catchments.

The Shoalhaven scheme, divided into three sta[ges], is being developed in order to increase safe s[ew]erage and supply system draft. It is headed [by] the Sydney Metropolitan Water Sewerage [and] Drainage Board (the Board) and by the Electr[icity] Commission of New South Wales (the Com[mis]sion). Facilities for phase 1 of stage 1 are discu[ssed] in detail. The Shoalhaven was chosen becau[se] it was the only catchment potentially able to m[eet] the Board's requirements up to the year 2[000]. Stage development was advised in order to cu[mu]latively increase the safe draft of the total sys[tem] of 340M1/day by 1975, 1250M1/day by 1982, [and] 2140M1/day by 2000. Stage 1 is functionally [di]vided into two projects: the Kangaroo-Fitz[roy] project which includes all works from the Tall[ong]a dam north to the Fitzroy Falls reservoir and w[hich] is involved in pumping capacities; and. the [Ya]rrawang-Wingecarribee project which include[s all]

s north of Fitzroy Falls reservoir that transfer
ed Shoalhaven water into the Nepean and
ndilly catchments and which will include the
ng of a dam. Operational and dimensional
or the various dams are shown in the tables.
ain features of the scheme comprise the Tal-
dam, the Bendeela power station, the
eela pipeline, the Bendeela pondage, the
aroo Valley facilities, and the Fitzroy canal
itzroy Falls dam. (Waltner-FIRL)

0, April 1975. 177 p, 3 fig, 25 tab,500 ref, 4 ap-
l. OWRT C-5344(4241)(1).

riptors: *Regional analysis, *Pacific
hwest U.S., Institutions, Legal aspects,
nology, *Streamflow, *Water alloca-
Policy), Low flow, Competing uses, Political
cts, Methodology, Flow.
tifiers: *Instream flow needs, Minimum
s, Information transfer.

stigation was conducted into the legal, politi-
and technological aspects of the process of
rmining stream flow requirements for various
, and establishing and preserving those flows.
ough the term 'methodology' is usually as-
ed to imply 'technical methodology,' many
edural steps, from the time of recognition of
for the preservation of flow in a stream to the
of flow establishment, are really parts of the
hodology.' Instream flow methodology should
considered as a water resource allocation
ess which includes: technological determina-
s of needs for the instream and out-of-stream
; flow recommendations and decisions in the
l-politcal arena; establishment of flow levels
er the law; and, maintenance and monitoring
he reserved flow or flows. Contacts were ini-
y established through several workshops con-
ed under an earlier project and through
stionnaires on the legal, political, and technical
cts of the problem. The questionnaires were
to various state and federal agencies in Utah,
gon, Washington, Idaho, Montana, Wyoming,
Colorado. Personal interviews with many
icy personnel were used to explore details of
agency programs and their methodologies.

EFITS AND COST OF DRAINAGE
TEMS,
lue Univ., Lafayette, Ind. Dept. of Agricul-
l Economics.
M. Naber, and W. L. Miller.

Available from the National Technical Information Service, Springfield, Va 22161 as PB-247 412, $5.00 in paper copy, $2.25 in microfiche. Purdue University Water Resources Research Center Technical Report No 65, August 1975. 88 p, 14 fig, 7 tab, 48 ref, append. Partial Completion Report. OWRT C-3277(3713)(8).

Descriptors: *Urban drainage, *City planning, *Community development, *Cost-benefit analysis, *Economic rent, Drainage systems, Urban runoff, Urbanization, Economics, Decision making, Cost comparisons, Cost-benefit ratio, Costs, Benefits.

A method is proposed for estimating the benefits and costs of providing adequate urban storm drainage facilities. This kind of information is essential for planners and decision makers for urban development. The concept of economic rent was used in the development of the model. For example, economic rent was condidered the increase in selling price of a residence due to the provision of adequate storm drainage facilities. The cost to provide the drainage system is equal to the expected loss in economic rent. Also involved was estimating and comparing the benefits and costs of providing storm drainage in an area prior to urbanization with the benefits and costs of providing storm drainage in an area where urbanization was complete. Results in the case studies used indicated that cost of installing adequate storm drainage facilities in an residential area was greater than the benefits derived. This conclusion did not take into account the value of damages accrued by other members of society as inconvenience of detouring flooded streets, street damage, etc. A comparison of the benefits and costs of providing storm drainage prior to urbanization resulted in a favorable ratio. Although the case study limits the applicability of the results, a similar approach to evaluate the benefits and costs of a storm drainage system can be used for other areas. NEPA'S INFLUENCE ON FEDERAL WATER PLANNING: PART I, EFFECT OF THE 'REVIEW AND COMMENT PROCESS' ON THE CORPS OF ENGINEERS AND SOIL CONSERVATION SERVICE,
Stanford Univ., Calif. Dept. of Civil Engineering.
W. W. Hill, and L. Ortolano.
Available from the National Technical Information Service, Springfield, Va 22161 as PB-247 433, $7.75 in paper copy, $2.25 in microfiche. EEP-Report No 52, September, 1975. 208 p, 5 fig, 15 tab, 55 ref, 2 append. Partial Completion Report. OWRT-C-4080(9017)(1).

Descriptors: *Environmental effects, *Project planning, *Administrative decisions, *Attitudes, *Administrative agencies, *Institutions, Social aspects, Water resources development, Small watersheds, Soil conservation, United States, Federal government, Institutional constraints.
Identifiers: *National Environmental Policy Act of 1969, *Environmental impact statement, *Soil Conservation Service, *Army Corps of Engineers, *Interagency coordination, Public involvement, Agency regulations, Council on Environmental Quality.

The review and comment (R and C) process refers to the circulation of environmental impact statements (EIS), and earlier informal versions thereof, to agencies and publics for review and comment pursuant to the requirements of section 102 (2) (C) of the National Environmental Policy Act of 1969 (NEPA). This report examines the effect that this process has had on Corps of Engineers pre authorization studies and Soil Conservation Service small watershed planning. The ways in which the R and C process might be used in attaining NEPA's policy objectives form the framework for the analysis which systematically examines: how the R and C requirements have been integrated into the Corps and SCS planning processes, the extent to which coordination has increased, the usefulness of the information obtained and the extent to which this information has influenced agency decision making. Data obtained from 242 questionnaires completed by planners in every Corps District and SCS State Office show that coordination with other agencies and publics has increased, though the respondents' perceptions of the utility of the information obtained as a result of this is mixed. One very significant finding is that the R and C process has forced planners to give more serious consideration to suggestions made by other agencies. However, the effect on final decisions appears to be limited because the R and C process is not begun until quite late in the planning process. Obstacles to an effective R and C process are discussed. (See also W76-01801)
W76-01800

NEPA'S INFLUENCE ON FEDERAL WATER PLANNING: PART 2, CASE STUDIES OF CORPS OF ENGINEERS' PLANNING IN CALIFORNIA,
Stanford Univ., Calif. Dept. of Civil Engineering.
J. Randolph, and L. Ortolano.
Available from the National Technical Information Service, Springfield, Va 22161 as PB-247 434, $8.00 in paper copy, $2.25 in microfiche. EEP-Report No 53, September, 1975. 228 p, 11 fig, 8 tab, append. Partial Completion Report. OWRR-C-4080(9017)(2).

Descriptors: *Environmental effects, *Project planning, *Multiple purpose projects, *Administrative decisions, *California, Water management(Applied), Attitudes, Social aspects, Feasibility studies, Institutions, Water resources development, Flood control, Water supply, Federal government.
Identifiers: *National Environmental Policy Act of 1969, *Environmental Impact Statements, *Army Corps of Engineers, *Interagency coordination, Statislaus River(California), Carmel River(California).

Two case studies were employed to examine the '102 process'; i.e., the procedures followed by federal agencies in the implementation of section 102(2)(C) of the National Environmental Policy Act of 1969 (NEPA). The effectiveness of the 102 process in integrating environmental factors in planning was analyzed. The approach relied on written documentation and personal interviews to provide an historical analysis of factors relevant to decision making in the context of the case studies. The Sacramento District's planning of the New Melones project on the Stanislaus River illustrates NEPA's influence in a situation where much of the planning occurred prior to NEPA's passage. NEPA's influence was limited to bringing about project modification features. The San Francisco District's planning in the Carmel River Basin was conducted after the passage of NEPA. In this case, the 102 process had little influence on the types of alternatives examined and on the determination of project size. The process did, however, have some influence on the introduction of project mitigation features. For the 102 process to be effective in implementing NEPA's policy goals, much more attention must be given to the implementation of sections 102(2)(A) and 102(2)(B) of NEPA. (See also W76-01800)

ECONOMICS OF WATER SUPPLY PLANNING AND MANAGEMENT,
Pennsylvania State Univ., University Park. Inst. for Research on Land and Water Resources.
J. C. Frey, H. B. Gamble, and O. H. Sauerlender.
Available from the National Technical Information Service, Springfield, Va 22161 as PB-247 560, $6.75 in paper copy, $2.25 in microfiche. Research Publication No 90, June 1975. 145 p, 56 tab, 8 fig, 5 append, 50 ref. OWRT C-3119(3688)(1).

Descriptors: *Droughts, *Cities, *Northeast U.S., *Water demand, Cost analysis, Elasticity of demand, Return to scale, Planning, Water management(Applied), Water supply, Water districts, Pricing.
Identifiers: *Water utilities, *Special water districts, *Shortage, *Water pricing.

A sampling of medium-sized cities in the Northeastern United States provided data and information useful in understanding the organization and management of municipal water utilities. The following objectives were pursued: (1) identification and description of political, demographic, systemic and economic characteristics of water utility systems that account for differential response patterns to shortage situations; (2) development of an index for evaluating the capacity of water supply systems to accommodate potential demands; (3) development of a cost function to determine whether economies of scale can be exploited in developing systems capable to avoiding drought shortages, and (4) estimation of the elasticity of residential demand for water to determine the feasibility of alleviating the consequences of drought by flexible pricing. A regression analysis was undertaken to ascertain the impact of selected variables on the supply-use ratios of the sampled utilities. Ownership patterns, the proportion of water used for residential purposes, variability in consumption requirements, and population density were the most significant factors. The long run elasticity of residential demand for water was approximately -0.20. In effect, a ten percent increase in price would probably reduce consumption only two percent. (Sink-Penn State)

CAPACITY OF WATER-BASED RECREATION SYSTEMS, PART III: METHODOLOGY AND FINDINGS,
North Carolina State Univ., Raleigh. Dept. of Recreation Resources Administration.
H. K. Cordell, G. A. Hammon, J. Graham, W. L. Hafley, and M. R. Warren.
Available from the National Technical Information Service, Springfield, Va 22161 as PB-247 557, $5.50 in paper copy, $2.25 in microfiche. North Carolina Water Resources Research Institute, Raleigh, UNC-WRRI Report No 90, September 1975. 109 p, 3 tab, 27 fig, 4 exhibits. OWRT B-013-NC(5). 14-01-0001-1936.

Descriptors: *Recreation demand, *Recreation facilities, *Boating, *Water skiing, *Swimming, Water sports, Water zoning, Model studies, Aerial photography, *North Carolina, Planning, Methodology.
Identifiers: Recreation capacity, Recreation planning, *Lake Burlington(NC).

This is the third of a series of publications reporting on research to develop methods, models, and guidelines for planning and managing water-based recreation systems. The previous reports are: Capacity of Water-Based Recreation Systems: Part I, The State of the Art - Gordon A. Hammon, Harold K. Cordell, et al, (April 1974) and Capacity of Water-Based Recreation Systems: Part II, A Systems Approach to Capacity Analysis - Gordon A. Hammon, Harold K. Cordell, et al, (July 1974). (See W74-07719 and W74-12364). In this report, methods conceptualized and tested for collecting and processing data describing recreational boating behavior are presented. The test site was Lake Burlington in the Piedmont of North Carolina. Means for data collection included questionnaires, interviewing, shoreline-based observation, and aerial photography. Based on an analysis of the interview and on-site observation data a major finding is that capacity, measured as number of boats which should use a lake system at the same time, probably should not be fixed by the managing authority. Boaters at the study site appeared to have acclimatized themselves to the frequently heavy use conditions which sometimes exceeded 1 boat per 6 acres of water surface. Thus managers and planners' continual for the magic number called capacity, which if found and used is believed to be the solution to many management problems, appears to be an unnecessary pursuit. (Stewart-North Carolina State)

DETERMINATION OF THE NUMBER OF COMMERCIAL AND NONCOMMERCIAL RECREATIONAL BOATS IN THE UNITED STATES, THEIR USE, AND SELECTED CHARACTERISTICS,
K. M. Bromberg.
Available from the National Technical Information Service, Springfield, Va 22161 as COM-74-11186, $5.50 in paper copy, $2.25 in microfiche. Report No NOAA-74051407, December 1973. 116 p, 3 append.

Descriptors: *Marine fish, *Boats, Sport fishing, Estimating, Statistical methods, Recreation, Saline water fish, Marine fisheries, Surveys.
Identifiers: *Salt water fishing.

To measure the impact of both commercial and noncommercial recreational boats in salt water fishery resources (the estuarine and ocean environment), the National Marine Fisheries Service must have current, accurate information. The findings of a survey research effort to determine the number of commercial vs. noncommercial recreation boats that fish in salt water, and the species sought by these boats is reported. Twenty-eight sampling units of noncommercial salt water sport fishing were created throghout the U.S. according to geographic proximity to salt water. Random telephone calls, distributed in the 28 sampling units according to the number of state licensed boats, were made with 941 of 9939 household respondents reporting that their household owned one or more boats. Estimates of (1) the number of private recreational salt water fishing boats, (2) the number of trips and days used per 12 months, and (3) species of fish sought are made. Commercial salt water fishing boats were sampled from listings of commercial sport fishing vessels with 159 of 163 operators of commercial recreational vessels responding. The number of boats, trips and days used in 12 months, fish species sought and annual gross revenue are estimated for all commercial salt water sport fishing vessels from these responses. PLANNING WATER RESSOURCES DEVELOPMENT.
Economic Commission for Asia and the Far East (UN), New York.
Available from U.N. Sales Office, New York or Geneva, for $2.50. Report of the Working Group of Experts on Water Resources Planning, Bangkok, August 29-September 9, 1968, Thailand. United Nations Economic Commission for Asia and the Far East, Water Resources Series No 37, (August 1969). 135 p, 4 fig, 3 tab.

Descriptors: *Water resources developm *Asia, *Comprehensive planning, *Internati commisions, *United Nations, Decision mak Prices, Standards, Financing, Discount rates, rigation, Project life, Project purposes, Intang benefits, Flood control, Multiple-purpose jects, Inland waterways, Income distribut Economic efficiency, Water supply, Hydroe tric power, Government finance, Psycholog aspects, Agriculture, Training, Financial feas ty, Economic impact, Evaluation, Interest ra Project benefits, Costs, Social aspects, Pro planning.
Identifiers: *Far East, *Project evaluation.

Prepared background papers and ensuing dis sions are presented for four sub-headings of ject matter from the joint meeting of the Econo Commission for Asia and the Far East (ECA and the United Nations Office of Techn Cooperation. This Working Group of Expe which met at Bangkok, Thailand in 1968, inclu representatives from 19 member countries, inc ing the USSR and the U.S. Under the topic procedures and standards for the economic financial analysis of water resources planning, definitions and applications were presented for concepts of opportunity cost, shadow price, terest rate, indirect tax, period of analysis and ject costs. Other background papers in this discussed the topics of irrigation developm costs at the farm level and the criteria used economic evaluation. Papers on social and economic, and social and economic considerati in water resources projects raised top questions ranging from planning and adminis tion to mobilizing public support. The coordina of various agencies covering water resou development and related fields, and other siderations important to the long range future water resources development are discussed. general conclusions and recommendations f the final sessions of the Working Group are cluded. W76-01818

MEASUREMENT STANDARDS FOR PROJE EVALUATION--PRICES AND INTEREST THE ECAFE SECRETARIAT.
In: United Nations Economic Commission Asia and the Far East, Water Resources Series 37, p 23-34, 4 tab.

Descriptors: *Project planning, *Evaluati *Methodology, Cost-benefit analysis, Inte rates, Discount rates, Prices, Inflation(Econom Risks, Asia.
Identifiers: *Market prices, *Shadow price.

The procedure to be followed in assigning pri and interest rates to physical resources involve a project (so that the benefits and costs of a p ject may be evaluated) is outlined. It is reco mended that market prices be used generally, the correct shadow prices should be used alter tively in those cases where market prices wo cause divergencies of crucial importance in dec ing a project's worth. Ambiguities arising from direct taxes and foreign trade tariffs are to resolved by using prices net of taxes in the form case and international prices in the latter. So average yield on longterm government bonds recommended as the correct interst rate, w noted exceptions. Discounting methods are m tioned. The effects of price changes independ of and resulting from the project on the valuati of the project are considered. Inflation genera must be ignored, especially if changes in relat prices do not occur. Cost-benefit analysis, wh both public and private participation are ticipated, should be carried out under two assum tions: (1) that private participation is forthcomi (2) that private participation is unavailable and t part of the project involving such participation w have to be shelved. The role of risks and unc tainties is analyzed. (See also W76-01818) (Beck Wisconsin)

JECT COSTS.
United Nations Economic Commission for
and the Far East, Water Resources Series,
7, p 35-41. 1 fig, 1 tab.

criptors: *Costs, *Evaluation, *Project
ning, *Estimated costs, Annual costs, Esti-
ng, Cost allocation, Capital costs, Right-of-
, Construction costs, Replacement costs,
rating costs, Maintenance costs, Asia.
tifiers: Resettlement costs.

ect costs are defined as the sum of all expendi-
s required to realize project objectives.
ects of costs estimation from both pre- and
-construction bases are discussed. Actual pro-
costs are determined only after a project has
completed and the accounting books closed.
mates of costs for planning purposes are
lly divided into three classes: (1) reconnais-
e estimate--prepared using already available
in order to get an initial judgement of the
bility of a project for further feasibility stu-
; (2) feasibility estimate--follows a positive
ement on the reconnaissance estimate and
more detailed and specific data in order to
the basis for authorization of a project; (3)
nite plan or pre-construction estimate--based
lata obtained for final designs and specifica-
s prior to letting out construction contracts.
ous components of capital costs are discussed
ore detail: costs of land and rights-of-way,
ulation resettlement, construction costs, farm-
elopment costs and annual costs. Specifically,
truction costs include field costs, engineering
design costs, administrative costs, investiga-
al costs, and interest. An annual cost figure is
lly used as a common basis for comparing
ect benefits and costs which occur at different
s during the life of the project. (See also W76-
8) (Becker-Wisconsin)
5-01820

IGATION DEVELOPMENT COSTS AT THE
M LEVEL.
d and Agriculture Organization of the United
ions, Rome (Italy).
United Nations Economic Commission for
a and the Far East, Water Resources Series No
p 43-57. 7 tab.

criptors: *Project planning, *Costs, *Irrigation
grams, *Water distribution(Applied), Asia,
m units, Irrigation efficience, Government
ports.

erience has demonstrated that the costs of ir-
tion projects at the farm level should be con-
red in project costs in order to avoid serious
ys of project benefits. Successful farm-
elopment measures in conjunction with irriga-
projects depend on: (1) careful water distribu-
to each farm plot; (2) land reform and con-
dation of small plots; (3) active well-supported
earch and extension programs; (4) credit provi-
s for fertilizers, improved seeds and pesti-
s; and (5) well informed and organized farmer
ociations. In order to evaluate the success of
n output stimulation programs all costs need to
dentified and evaluated. These costs can be di-
ed into (1) service area development cost--the
ts of making water available at the boundary of
l area; (2) farm development costs--including
major items of land leveling and smoothing,
l preparation, and drainage; (3) government
port costs--those costs for services and
stance that the government needs to furnish to
area in order to improve farm production and
farmers' standard of living and to secure return
n investment. Farmers' attitudes and coopera-
in operation and maintenance of irrigation
tems is considered as a factor in irrigation
elopment costs. (See also W76-01818) (Becker-
sconsin)
6-01821

IDENTIFICATION AND MEASUREMENTS OF ECONOMIC PROJECT BENEFITS.
In: United Nations Economic Commission for Asia and the Far East, Water Resources Series No 37, p 58-70.

Descriptors: *Evaluation, *Project benefits, *Economic impact, *Water resources development, Irrigation, Flood control, Hydroelectric power, Navigation, Water supply, Watershed management, Measurement, Asia, Direct benefits, Indirect benefits, Fringe benefits, Alternative planning, Recreation.

The economic benefits of a project are represented by the increase in the value of the output goods and services stemming from the project and are measured by their quantities and their market prices. Definitions of primary, secondary, and national project benefits and associated costs are provided. The benefits of water resources projects are identified on the basis of the need for development; principles and assumptions involved in the measurement of benefits are discussed; procedures of measurement of benefits are described; and limitations of the application of present valuation techniques are pointed out. The reliability of benefit measurement depends on conditions which vary from country to country: available knowledge about the project's future; projection of future conditions; and the measurement techniques applicable and selected. Seven project-types are discussed in terms of evaluation techniques, primary and secondary benefits, and demand for the project-type. They are irrigation, flood control, hydro-power, navigation, public water supply, recreation, and watershed management. Limitation of the present knowledge concerning benefit measurement includes incomplete information on input and output; biased projection techniques; nonuniformity of the standard of value among beneficiaries, and the necessity of considering other measures in planning decisions. (See also W76-01818) (Becker-Wisconsin)
W76-01822

CRITERIA OF ECONOMIC EVALUATION IN WATER RESOURCES DEVELOPMENT.
In: United Nations Economic Commission for Asia and the Far East, Water Resources Series No 37, p 71-80.

Descriptors: *Project planning, *Water resources development, *Economic impact, *Evaluation, Economic efficiency, Income distribution, Project benefits, Costs, Welfare(Economics), Gross National Product, Asia, Cost-benefit ratio.

Goods and services from multipurpose water resources projects are diverse in nature, meeting various needs and desires of the people which may also be met by alternative means. In order to make a comprehensive assessment of the effectiveness and efficiency of water resources projects in attaining the ultimate societal goals, various evaluations from different viewpoints have to be made. Goods and services produced by water resources projects can be classified into three categories: (1) incidental benefits--for which no substantial costs are incurred in their production; (2) goods and services produced without conflict with other possible uses; (3) goods and services produced in conflict with other uses. The objectives of economic evaluation of water resources projects include: the determination of the functions to be included in the project and the optimum scale of development for each function, the examination of the effectiveness and efficiency of each alternative plan of a project in meeting economic, social, and political goals, and the provision of economic data to establish cost allocation. Economic efficiency criteria and redistribution of income criteria are discussed on theoretical and applied bases. Benefit-cost, rate of effectiveness, and minimum cost criteria are examined individually. (See also W76-01818) (Becker-Wisconsin)
W76-01823

FINANCIAL ANALYSIS.
In: United Nations Economic Commissions for Asia and the Far East, Water Resources Series No 37, p 81-99. 17 tab.

Descriptors: *Water resources development, *Financing, *Return(Monetary), Loans, Debt, Interest, Reimbursable costs, Non-reimbursable costs, Cost repayment, Amortization, Asia.
Identifiers: *Financial analysis, Foreign loans.

The development of water resources entails the creation of lasting physical assets, at the same time, because development can seldom be financed out of revenue, it mortgages the future. The financial analysis of a proposed development project serves to demonstrate that the project can be financed in such a way that the costs of development can be repaid out of direct monetary returns accruing to the project during the maturity of the loans raised to finance it. The financial analysis includes only the direct monetary returns or revenues and spans the terms to maturity of the loans. It allocates the total financial cost to various beneficiaries and assesses how much they should pay. Local and foreign indebtedness, government subsidies, reimbursable and nonreimbursable costs, and repayment schedules are discussed in terms of their application to and their considerable impact on the financial analysis. Also discussed are: (1) project costs--entering the financial analysis as either capital costs or operations maintenance and replacement costs; (2) the financing of the foreign-exchange and local-currency components; (3) and repayment capcity. Two comprehensive examples of financial analysis are included. (See also W76-01818) (Becker-Wisconsin)
W76-01824

SOCIAL AND NON-ECONOMIC CONSIDERATIONS IN WATER RESOURCES PLANNING AND DEVELOPMENT.
In: United Nations Economic Commissions for Asia and the Far East, Water Resources Series No 37, p 100-123. 2 fig.

Descriptors: *Project planning, *Water resources development, *Social aspects, *Social participation, Institutions, Social impact, Social needs, Social change, Asia.

The improvement of social welfare is generally accepted as the essential, overriding purpose of planned development; so far, however, national planning and development in Asia have yielded very meager benefits. Levels of nutrition and housing are static or declining, while unemployment and underemployment remain chronic, and the distribution of national income seems to be becoming increasingly uneven and inequitable. This unfavorable and potentially explosive situation can be attributed partially to the sluggish pace of economic growth in Asia and to widespread neglect of social considerations in development planning. Lack of energetic public participation in national development efforts is one cause for the slow rate of development. Main elements in the promotion of dynamic social change are identified. Major program approaches that should be built into water resources development schemes in order to serve the objectives of productivity oriented income redistribution and promotion of massive popular support are discussed in terms of project evaluation, integrated agricultural and industrial development, and social services and allied programs. Also considered is the handling of social and noneconomic problems of water resources development in terms of policy-making and planning, integration of planning and fiscal policies, preparation of planning, administrative, and technical personnel, and research and evaluation. (See also W76-01818) (Becker-Wisconsin)
W76-01825

CO-ORDINATING THE ACTIVITIES OF ALL AGENCIES GOVERNING WATER RESOURCES DEVELOPMENT AND RELATED FIELDS.
In: United Nations Economic Commission for Asia and the Far East, Water Resources Series No 37, p 124-135.

Descriptors: *Administration, *Project planning, *Water resources development, Governmental interrelations, Inter-agency cooperation, Asia, Australia.
Identifiers: Taiwan, Indonesia, India, Iran, Japan, Laos, Malaysia, Nepal, Pakistan, Philippines, Singapore.

The countries of Asia and the Far East, with their agrarian populations and developing economies, consider water to be one of their principal resources and place much emphasis on its development and utilization. It is, therefore, important that there should be a well-considered and defined policy for the development of water resources of each region or basin, aiming at the use of water from all sources, for the greatest benefit of the people and compatible with the national plans for overall economic and social development. The preparation of basin plans or the development of other major water resources projects entails the collection, compilation, and analysis of a large mass of data and calls for cooperation and coordination among specialists in many fields. There must be a strong and competent organization to handle the coordination of the many activities. The roles of individuals, and of local, state, and national government and their agencies are explained. Examples of activities characteristically recognized as local, regional, or national responsibilities are given. The coordinating agencies are outlined for some of the ECAFE (Economic Commission for Asia and the Far East) countries: Australia, Ceylon, Taiwan, India, Indonesia, Iran, Japan, Laos, Malaysia, Nepal, Pakistan, Philippines, and Singapore. Identifiers: Public policy, Available flow, *Ontario.

This essay examines, from an economic point of view, the efficiency of the complex framework of water law regulating water use in Ontario. There are two primary dimensions of water as a valuable resource. One is its physical quantity, which is useful in both 'withdrawal uses' such as domestic consumption and industrial processes and in 'in place uses' such as power generation and navigation. The scarcity factor, or 'available flow' can be augmented and regulated by various works. The other dimension of water is its capacity to absorb and disperse wastes. The scarcity factor in this dimension is referred to as the 'assimilative capacity' of the watercourse. It can also be augmented. Topics discussed concerning the available flow dimension include: legislative provisions; administration of the permit system; federal involvement; municipal and regional arrangements; and economic implications of flow allocation arrangements. Topics explored concerning the assimilative capacity include: common law doctrines; the discharge approval system; municipal-provincial arrangements; and the economic application of quality control arrangements. Journal American Water Works Association, Vol 67, No 5, p 220-224, 1975. 6 fig, 20 ref.

Descriptors: *Water works, *Pricing, *Investment, Return to scale, Economies of scale, Costs, Water demand, Elasticity of demand, Model studies.
Identifiers: *Peak load pricing.

As the demand for water grows in the serviced area, the price of water should rise during periods of peak usage; the rise in price should be just large enough to equate the quantity demand with the quantity supplied. Based on the assumption that increases in demand can be correctly anticipated, the original plant will be built larger than required at the time of construction to allow for economies of scale in the production and distribution of water. This will result in that initially the peak price of water may be no more than marginal running cost. However at some point in time, th sum of charges exceeding marginal running co will begin to amortize the original fixed investmen plus those costs associated with waiting for th payment to be made. Two cycles of concern f water supplies are emphasized--the demand cyc and the envestment cycle. The response of wate prices to these cycles should be that rise with in creased demand, and that prices fall with increase in excess capacity, whether an increase in exce capacity occurs as the result of an expansion o the existing plant or a slackening of deman (Auen-Wisconsin)

DALLAS RATE SURVEY.
Dallas Water Utilities Dept., Tex.
Journal American Water Works Association, Vo 67, No 5, p 232-238, 1975. 13 tab.

Descriptors: *Surveys, *Water rates, Wate works, Alabama, Arizona, California, Colorado District of Columbia, Florida, Georgia, Hawai Indiana, Illinois, Iowa, Kansas, Kentucky, Mary land, Massachusetts, Michigan, Missouri, Min nesota, Nebraska, New Jersey, New York, Ne Mexico, North Carolina, Oklahoma, Ohio Oregon, Pennsylvania, Tennessee, Texas, Vi ginia, Washington, Wisconsin.
Identifiers: Dallas(Tex).

A 1974 water rate survey conducted by the Dalla Water Utilities, Texas, includes data for 62 util ties from cities in 28 states and the District o Columbia. All the utilities service areas where th urban population are in excess of 125,000. In add tion many service, either directly or indirectly areas beyond that of the inner city. One set of ta bles is concerned with the billing procedure an the second set gives data about charges. Th billing procedures include information on: Wate supply (ground, surface, or combination); syster municipally owned; penalty or discount, an amount, plus time period; delinquent meters be fore turn-off or other action; penalty charge for in sufficient fund checks; turn-on charges, by week day, evening, weekend, and holiday; service ca charges; transfer fee; deposit required for com mercial and residential installations; interest pai on deposit accounts; rate increase next year; per cent of increase; and date of last increase. The me tering data include monthly or semimonthl billing; minimum charge; quantity of water fo minimum charge; meter size for new charge revenue source; volume measurement (cu ft o gal); monthly meter residential rate by volume in crements; and percentage added for outside cit limits for retail service to residential customers (Auen-Wisconsin)

DREDGING COSTS: THEIR ESTIMATION ANI IMPLICATIONS TO THE MANAGEMENT O DREDGING OPERATIONS,
University of Wales Inst. of Science and Tech Cardiff. Dept. of Maritime Science.
R. J. Webb.
Dock and Harbour Authority, (U.K.), Vol 54, N 64, p 406-409, 1974. 2 fig, 6 tab.

Descriptors: *Dredging, *Costs, *Estimating *Harbors, Indirect costs, Direct costs, Cost allo cation, Depreciation, Economic life, Interes Operating costs.
Identifiers: Costing systems, NIVAG cost mode Inflation.

To measure the cost-efficiency of a harbo dredging operation and to provide a basis for pre dicting the effects of operation changes on cost-ef ficiency (emphasizing the level of direct costs an the distribution of costs of the various heads) thre costing systems are compared: (1) The traditiona financial account; (2) the 'NIVAG' cost mode which is used by many Dutch contractors fo building up their tender prices. It is designed t

redict rather than record costs, and only the perating costs are left for calculation from earlier ecords; and (3) opportunity costing, achieved by omparing the port's options at the close of the ear to those at the year's opening. It is shown that he financial accounting seriously underestimates he costs of operating a dredger and should not be sed. Also that the operation is capital intensive. If he NIVAG maintenance costs are reduced to the ort authority level, the capital distribution to the IVAG total is 65%. Research should therefore be irected towards the minimization of capital in-olvement rather than overtime limitation or fuel conomy. To increase output two basic choices re available: (a) purchase and employ larger or ore craft; (b) work existing craft more intensive-and/or reduce down time. (Auen-Wisconsin)

CHEDULING MAJOR CAPITAL EXPENDI-URES TO MINIMIZE COSTS,
lazen and Sawyer, New York.
/. B. Sinnott.
ournal American Water Works Association, Vol 7, No 5, p 271-174, 1975. 1 fig, 3 tab.

escriptors: *Water works, *Investment, *Annual osts, Interest rates, Construction costs, Financ-ig.

he effect on annual costs of scheduling water orks improvements is discussed. The practice of aking investment decisions based only on scalating construction costs fails to recognize the hanges in the value of the dollar. One method of ollar evaluation is to use the difference between he rates of change of construction costs and those r the cost of living, herein designated as 'relative scalation' of construction costs. Another factor n scheduling capital improvements is interest ates. Long-term downward trends and shortterm ariations offer excellent opportunities to chedule capital improvements to reduce overall osts. Among the examples cited are that a ecrease in interest rates of 0.25%/year will offset he effect of a 3%/year relative escalation of con-truction costs, and a decrease in interest rates of .42%/year will offset the effect of 5.0%/year rela-ve escalation in construction costs. Also varia-les in investment decisions are the effects of epreciation on capital improvements, broader nancing options with time, and avoidance of ad-itional operating costs by delayed construction. /ith interest rates at or near the top, forecasting eneral long-term trends would seem to be less sky than during a period of average rates. /ATER RATE REFORMULATION,
/ilmington Water Dept., Del. Water Commission.
. J. Maitland.
ournal American Water Works Association, Vol 7, No 5, p 262-263, 1975. 3 tab.

escriptors: *Public utilities, *Water rates, Pricing, *Equitable apportionment, *Delaware, /ater utilization, Cities, Suburban areas, Industri-l water.
dentifiers: Wilmington(Del).

he Wilmington, Delaware, water department esigned a new water rate structure to equalize ater costs between the city and suburban users, nd between small-volume users and large-volume ustomers. Alternative costs and price sets were eveloped based on management priorities, en-ineering, and economics. The typical city and ounty fixed and variable costs were built into ach cost set. Additional variable costs were built to the cost sets to reflect different management ecisions, such as city overhead, additional anagement staff, pension accruals, and a 3-6% eturn on investment. Engineering considerations ere used to distribute the fixed costs to arrive at base, fixed charge per customer based on the capacity factors of the variously sized meters. The new rate structure, which went into effect July 1, 1970, has been adequate to meet the costs of the water system through 1975. The side-effects generated by this rate revision were that some customers reduced their meter size, water consumption has dropped, new rate structure emphasizes accurate metering, which in turn necessitated acceleration of a meter-replacement program; meter readings are done oftener to divide the bill into smaller segments; and the 12-year interval in rate revisions resulted in a sizeable rate increase, causing customer dissatisfaction. MUNICIPAL IMPOSTS AND LEVIES FOR ONTARIO WATER UTILITIES,
Beaufort Engineering and Development Ltd., Burlington (Ontario).
H. E. Sears.
Journal of American Water Works Association, Vol 67, No 5, p 258-261, 1975. 2 fig, 4 tab.

Descriptors: *Public utilities, *Water users, *Distribution systems, *Assessments, Local governments, *Canada, Pipelines, Installation costs.
Identifiers: *Ontario, Water installation charges.

The charges and assessments imposed by various Ontario municipalities on subdivision or industrial developments for installation of water service systems are detailed. In most new subdivisions the developer pays for a system that does not exceed 8 inches. About half of utilities pay for oversized mains--in excess of 6 inches. Most of the rest pay varying amounts according to a formula, which is different for virtually every municipality. In apartment developments, assessments vary from nothing to several hundred dollars per unit. It is difficult to establish what fraction of the levy is turned over to the water utility. In industrial developments the total cost of servicing is usually charged. However, there are relatively few service districts that make additional frontage charges for oversized mains. Although the Local Improvement Act offers the municipality the responsibility for providing fire protection, very few municipalities take this into account in their subdivision agreements. DEMAND-RATE ECONOMICS,
Black and Veatch, Kansas City, Mo.
H. J. Lobb.
Journal American Water Works Association, Vol 67, No 5, p 247-250, 1975.

Descriptors: *Water rates, *Water demands, *Equity.
Identifiers: *Demand rates.

A substantial part of the annual costs of a water utility are related to providing and maintaining adequate system capacity to meet the maximum demands imposed upon the system, thus costs associated with meeting maximum demands should be properly recognized in the design of water rates. A demand rate for water service is a two-part rate in which customer charges are based upon both quantity of water used and the maximum rate of use and is more equitable than block-type rates. For example, any time the system's maximum demands are two or more times the average demand 50% or more of the system capital costs are allocable to demand capacity required. Studies of 11 water utilities indicated that extra capacity costs ranged from 30% to 46% of the total annual costs, or an average of 38%. Smaller users, as a group, characteristically have a maximum-to-average demand ratio that may require four additional units of extra capacity for every unit of water sold. Conversely, large users, as a group, have a ratio of maximum-to-average demand with extra capacity requirements of only one additional unit. Reduction or curtailment in maximum demands through appropriate charges can reduce the need for additional capital expenditures. (Auen-Wisconsin)

FORMULATION OF WATER RATES FOR BALTIMORE COUNTY, MD.,
Baltimore County Dept. of Public Works, Towson, Md.
W. J. Herberich.
Journal American Water Works Association, Vol 67, No 5, p 244-246, 1975. 5 tab, 1 ref.

Descriptors: *Water rates. *Formulation, *Public utilities, Water distribution(Applied), Water districts, *Maryland.
Identifiers: *Baltimore(Md).

The City of Baltimore operates all the water facilities in Baltimore County and faced a deficit of about $700,000 in fiscal 1973 unless the water rates for the county were revised. A water rate structure based on 'cash needs' through fiscal 1977 was formulated to meet the required revenue of $10.4 million. The minimum charge, based upon the ratio of capacity of a given meter size to the capacity of a 5/8-in. meter was not increased. The rating system for domestic usage was expanded from 5000 to 100,000 cu ft/quarter, thus combining the first two divisions of the sliding scale into one step. The intermediate step for usage between 100,000 and 1 million cu ft/quarter and the wholesale step for usage greater than 1 million cu ft/quarter were maintained. A service charge of $1.50/quarter for 5/8-in. meter and a commodity charge of $2.30/1000 cu ft of consumption in the domestic step were assigned which resulted in an annual charge at about $36 for an average domestic county customer. County constructed water facilities are not financed through the water rate structure but are financed by two annual charges and two one-time charges. (Auen-Wisconsin)

ECONOMIC IMPACT OF RECENT ENVIRONMENTAL LEGISLATION,
Water and Wastewater Equipment Manufacturers Association, Chicago, Ill.
R. Aldrich.
Industrial Water Engineering, p 12, 14, 16, 17, July/August 1973. 1 tab.

Descriptors: *Legislation, *Economic impact, *Pollution abatement, Industries, Recycling, Costs, Benefits, Financing.

The cost to industry necessary to bring pollution abatement facilities to meet existing or proposed environmental standards, in addition to capital cost should include operating and maintenance cost of these facilities; cost savings in possible recovery of waste material or energy; increased costs of raw materials and services due to pollution control by suppliers; size and age distribution of facilities; price elasticity or inelasticity inherent within any industrial classification; competitive factors--both at home and abroad; dependence on municipal waste treatment facilities by certain industry types and locations; and ability of industry to increase debt and how this relates to the individual corporation's potential growth. Although long-term pollution control costs will eventually be internalized, for the next five to ten years the impact of these additional costs must be alleviated. The primary need is to provide the lowest cost capital dollars with repayment scheduled over the longest period of time, thus reducing cash flow impact. This is best accomplished using 100% financing through tax-exempt pollution control industrial revenue bonds. Coupled with rapid depreciation of the pollution control facilities and the Investment Tax Credit amounts allowable, this financing technique can account for up to 30% in savings on the cost of the total investment. TRUE COST OF CONVENTIONAL WATER,
Parsons, Brinckerhoff, Quade and Douglas, Inc., Denver, Colo.
F. W. Montanari, and D. E. Mattern.
Journal American Water Works Association, Vol 67, No 5, p 251-254, 1975. 6 fig, 1 tab, 4 ref.

Descriptors: *Water works, *Water costs, *Water sources, Water rates, Distribution.

The total costs and production costs of both private and municipal water utilities surveyed, grouped by population, are summarized. Utilities supplied primarily from ground water showed a higher unit cost for low production rates (up to 10,000 mil gal/yr) but a higher surface-water unit cost at incrased production rates. The 115 utilities reported serving about 67 million people. Of these, 109 serving about 45.3 million people reported about 8.4 million connections, and 92 serving about 33.1 million people reported a total of about 6.3 million residential connections and nearly 768,000 nonresidential connections. The aggregate production of the 115 utilities was almost 4.1 trillion gal/year. The average per capita production was about 186 gpd. The aberage total cost per person per year was about $18.50, or about 5 cents/person/day. Data by population groups broken down by source--ground, surface, and combinations--are shown. As the population range of the groups increases there are expected economies of scale. The effect of raising water rates in 68 cities was that 56 showed no effect on usage, one showed a decrease with a 50% rate incrase, three cities reported some decrease and eight reported a temporary or a slight effect. (Auen-Wisconsin)

TRENDS IN WATER RATES,
Black and Veatch, Kansas City, Mo.
C. W. Keller.
Journal American Water Works Association, Vol 67, No 5, p 255-257, 1975. 2 ref.

Descriptors: *Water rates, *Return(Monetary), Water works, Utilities.

The inflationary trend increases the propo rtion of revenues that must be devoted to operation and maintenance and the required investment per customer. Several methods of recovering water service costs are discussed. A recent trend has been to lessen the proportion of the cost to be refunded in local main installations and to shorten the allowed period of development. Many water systems make no refunds or require all main extensions to be installed by developers. Another trend has been to charge new customers a fee for 'back-up facilities.' The amount may range up to several thousand dollars per residential customer. If utility growth occurs because of added retail connections to a wholesale customer, one method is to charge a higher rate for use over a stated base amount. Current thinking in designing rate structures is presented in the AWWA Water Rates manual. That method usually results in usage of the meter block rate for the majority of customer classes and provides for unit charges that decrease as greater consumption levels are reached. Water price increases are only a slight deterrent to its use, as there is no elasticity in water demand, and would probable have little lasting effect on design of a major improvement. FORECASTING URBAN WATER USE: COMMERCIAL ESTABLISHMENTS,
Maryland Univ., College Park. Dept. of Civil Engineering.
R. H. McCuen, R. C. Sutherland, and J. R. Kim.
Journal American Water Works Association, Vol 67, No 5, 239-244, 1975. 4 tab, 7 ref.

Descriptors: *Water demand, *Water utilization, *Forecasting, Equations, Future planning(Projected).
Identifiers: *Shopping centers, Commercial water usage.

With more than 55% of the total U.S. employment in the service sector and the moratorium placed on new sewer-line hookups in many areas, water-use relationships for commercial establishments will be able to anticipate water demand. Relationships for estimating average daily water use are provided for department stores and mall shops located in shopping centers from data compiled in one shopping center in Greendale, Wisconsin, one in Baltimore, Maryland and two in suburban Washington, DC. Water-use relationships and the estimates of floor space for each 4-digit SIC (Standard Industrial Classification) category were used to estimate the potential water demand. Most water use in commercial establishments is currently for domestic-type purposes but planners of water-demand forecasting models should consider water demand for nondomestic purposes. The gross store area was used to drive water-use relationships because that variable is easier to determine than the number of employees per shift. The linear model containing both slope and intercept coefficients provided better estimates than the linear model that does not include the intercept coefficient. The layout and design characteristics, transportation balance, and labor productivity would probably be the most important system variables in commercial water-demand forecasting. (Auen-Wisconsin).

study was designed to provide information on
decision making and organizational charac-
ics of municipality owned water systems in
and medium-sized Illinois municipalities,
o relate these characteristics to municipal as
as other water system characteristics. Data on
unicipal water systems of 228 Illinois incor-
ed municipalities were gathered through mail
elephone surveys, as well as from secondary
es. The municipalities were chosen as part of
ercent sample, stratified by size, of all incor-
porated municipalities in Illinois with populations between 1,000 and 50,000. In addition to selected descriptive information on the water systems, the data are reported under water system decision making; planning and financial management; and technical management. Attempts to determine the relationships between the dependent variables and municipal and water system characteristics indicated a general weakness or absence of such relationships. While the quality of the data cannot be ruled out with certainty as the reason for the absence of the relationships, it is suggested that the relative lack of active interest on the part of municipalities in their water systems may account for the findings. The historical absence of the necessity to actively manage the water system other than in a routine fashion may have left these water systems quite unprepared to meet future sudden challenges.

Identifiers: Urban studies programs.

With data obtained from U.S. statutes, congressional documents and publications of federal agencies, this report examines the Corps authority and responsibility in national resource planning which includes developing studies of major river basins, flood plains, waste water management, structural design, and coordinating and assessing federal policies and programs. National economic development and environmental quality objectives are used by the Corps to develop consistent programs and plans. COE's largest planning effort, the urban studies program, integrates water resources management with locally determined regional goals by developing alternative plans which include a capital improvements element, management (non-structural) program and revision program which provides flexibility and responsiveness to possible changes in needs. Today's COE's activities involve all aspects of planning for water and related land resources development to further environmental quality, economic development, and other national policy guidelines while cooperating with local, state and regional governments. Planning capabilities of COE represent a significant national asset for water resources development, land use planning and environmental quality enhancement. (Salzman-North Carolina)

FUTURE WATER POLICIES,
Soil Conservation Service, Washington, D.C. River Basins.
E. C. Buie.
Journal of Soil and Conservation, p 211-213, September-October 1973.

Descriptors: *Water policy, *National Water Commission, Water resources development, Federal government, Local governments, Cost allocation, Channel improvement, Irrigation, Agriculture, Financing, Flood control, Flood plains, Erosion control, Sedimentation, Recreation, Wildlife, Reservoirs.

Some comments on the 1973 National Water Commission's report discuss its conclusions regarding the role of the federal government in water resources development particularly the recommendation and its impact that the state and local agencies assume full responsibility for flood control, irrigation, drainage, water supply, and navigation, and that identifiable beneficiaries bear the full costs of all developments for flood control and irrigation; it would also impose charges on users of inland waterways. Recommendations are made that evaluation reflect costs estimates of damages caused by increased downstream flood and sedimentation, lowering groundwater levels, fish and wildlife habitat losses, and esthetic values in channelization projects. The Commission recommends that federally funded water resource development projects resulting in increased food and fiber production be fully repaid. Eighteen recommendations for changes are offered in flood control efforts. The report discusses the various federal programs and state responsibilities in recreation reservoirs and fish and wildlife aspects. It suggests user fees for recreation and does not recommend full federal funding for the recreational aspects of these developments. Major adjustments in the engineering responsibilities of the Soil Conservation Service, Army Corps of Engineers and the Bureau of Reclamation are suggested. There appears to be some dichotomy in recommendations for rural water development. (Auen-Wisconsin)

This research was a case study and analysis of the most salient influences in the enactment of Natural Resources District legislation in the state of Nebraska. Research methods included extensive analysis of documents, open-ended interviews, and quantitative analysis of roll-call voting. The research results showed that reorganization legislation was the culmination of a six year controversy between a relatively small well-informed group of people with a great interest in soil and water conservation. The controversy was aired before an apathetic public and a Legislature that was not particularly familiar with the issue. The research further indicated that the level of public understanding was low, that there was considerable lobbying activity by various interests, that a few key individuals both in and out of the Legislature had a great impact on the controversy, that lobbying in some districts had an impact on the voting of legislators, that rural legislators were divided on the issue while urban legislators generally supported reorganization, and that some of the customs and practices of the Nebraska Legislature enhanced passage of the reorganization legislation.

SUMMARY OF 1975 ROCKY MOUNTAIN LAND USE AND NATURAL RESOURCE BILLS.
Federation of Rocky Mountain States, Inc., Denver, Colo.
October, 1975. 53 p, 1 tab.

Descriptors: *Rocky Mountain Region, *Land management, *Water management(Applied), *Natural resources, *Legislation, Arizona, Colorado, Idaho, Montana, Nevada, New Mexico, Utah, Wyoming, Water conservation, Water resources, *Land use, Land resources, Administration, Planning, Water law, Legal aspects.
Identifiers: Natural resources development, Natural resource bills.

A summary is provided of state legislative activity affecting land use and development of the natural resources of the Rocky Mountain states: Arizona, Colorado, Idaho, Montana, Nevada, New Mexico, Utah and Wyoming. The bills summarized include water legislation, mineral taxes, impact areas' taxes, plant siting laws, conservation, environmental protection, reclamation, land use, manpower training, research units and interim committees, and other natural resource issues. Water legislation is divided into allocation, minimal requirements, agricultural properties, quality, and state's rights. Each bill is listed, briefly summarized, and its failure or passage is indicated. (Robinett-Arizona)

LOCAL LAND USE CONTROL OVER CRITICAL AREAS,
American Society of Planning Officials, Chicago, Ill.
C. Thurow.
Civil Engineering-ASCE, Vol 45, No 9, p 73-76, September, 1975. 4 fig.

Descriptors: *Land use, *Local governments, Environmental control, State governments, Legislation, Permit, Developed waters, Standards, Groundwater, Sand aquifers, Wetlands, Streams.
Identifiers: Land development, Special interest groups.

States can no longer handle all of the environmental problems and decisions that may develop. Along the southeastern coast of Texas recently, the sand aquifier has been heavily pumped, causing groundwater to be extracted faster than it could be replaced. Expensive problems have developed. The willingness of local communities to become involved in regulating local environmental problems is discussed. The planner in a community is the best qualified on a local level to judge what degree and type of development a particular area will tolerate. The other approach is by making local ordinances prohibiting certain types of development or limiting use of such areas as wetlands or streams. Most ordinances remain simple, allowing light use or use with a special permit, but some have moved beyond that stage. Very few have been challenged in court, the most important reason being that they are more flexible than they appear. Their main purpose is to insure the involvement of local government in the development process. They force a case by case administrative process, requiring more time and more expertise on the local level. Disadvantages that may arise are the probabilities of human error in difficult decisions and pressure from special interest groups. Environmental performance standards can overcome some of the difficulty, by promoting compatible development. (Pinto-FIRL)

of the central issues before the Third U.N. erence on the Law of the Sea is the extent of al States' rights over living resources. Mid- hrough this meeting, the International Court stice decided two important fisheries jurisdic- cases dealing with this problem. Iceland and Britian and Iceland and West Germany were tigants. Following a failure of the interna- conference to agree on the breadth of the orial sea, Iceland extended its exclusive fish- one to fifty miles. The two applicant states t a determination of whether Iceland's claim ontary to international law, and whether con- tion of fish stocks was subject to interna- regulation. A majority of the Court held that d had preferential rights in waters beyond velve mile limit, but refused to say that such have a basis in international law. rential rights exist when a coastal State is al dependent on coastal fisheries. This theory debatable validity since it stems from custo- rather than legal precedent. (Jenkins-Florida) 01954

COMPREHENSIVE WETLANDS PROTECTION: ONE STEP CLOSER TO FULL IMPLEMENTATION OF SECTION 404 OF THE FWPCA.
Environmental Law Reporter, Vol 5, No 7, p 10099-10104, July, 1975. 6 p, 28 ref.

Descriptors: *Navigable waters, *Wetlands, *Federal Water Pollution Control Act, *Federal jurisdiction, *Administrative agencies, Judicial dicisions, Fish reproduction, Wildlife habitats, Environment, Flood control, Ecology, Ecosystems, Environmental effects, Marshes, Tidal marshes, Regulation, Permits, Water conservation, Preservation.
Identifiers: *Ecological functions, *FWPCA Amendments of 1972.

There has been considerable disagreement concerning the scope of federal regulatory jurisdiction over dredge and fill activities throughout the nation under Section 404 of the Federal Water Pollution Control Act Amendments of 1972. A recent court ruling has held that Section 404 expands the Army Corps of Engineers' jurisdiction over the depositing of dredged or fill material to 'waters of the United States', and not just to 'navigable waters'. The former term is much broader, encompassing non-tidal, inland wetlands which provide areas vital to fish propagation, natural flood control, and wildlife habitat. As a result of this decision, the Corps, which favored the more restrictive interpretation, published proposed revised regulations concerning its permit jurisdiction under Section 404. The Corps accompanied publications of the proposals with a press release aimed at stirring up public sentiment against the enlarged jurisdiction of Section 404. The facts and reasons behind the Corps negative reaction to a broad reading of Section 404 are explored in detail. (Hoffmand-Florida)

MARICULTURE: A NEW OCEAN USE,
Georgia Univ., Athens. Inst. of Government.
J. O. Smith, and D. L. Marshall.
Georgia Journal of International and Comparative Law, Vol 4, p 307-342, 1974. 36 p, 246 ref.

Descriptors: *Marine plants, *Aquatic plants, *Jurisdiction, *International law, International waters, Oceans, Marine biology, Water types, Law of the Sea, Estuaries, Foods, Food abundance, Productivity, Standing crops.
Identifiers: *Mariculture, *Coastal waters, Contiguous zone, Marine sanctuaries.

The authors suggest that future world food requirements may lead to use of territorial waters and high seas for purposes of mariculture--the artificial culture of marine organisms. A coastal nation's sovereignty diminishes seaward of the shoreline, and so possible international interference with American entrepreneurial efforts in this regard will increase proportionally to the distance of a given enterprise from American territory. Examples of maricultural endeavors include transplantation of clams and oysters to improved habitats and the maintenance of cultures of shellfish and free-swimming fish in enclosures suspended near the water surface. The authors conclude that the barriers to these enterprises represented by international law of the sea are not as great as might be expected, even in the realm of the high seas. Mariculture activities are legally distinguishable from extant ocean uses and should be treated differently from such practices as fishing, navigation, and mineral exploration and exploitation. The authors survey the state of relevant existing law as it affects maricultural purposes in each of five ocean areas: (1) territorial waters between the coastal baseline and a line three miles seaward; (2) the contiguous zone, between three and five miles from the baseline; (3) the high sea beyond twelve miles; (4) the submerged lands under the territorial sea; and (5) the continental shelf. INVENTORY AND QUANTIFICATION OF FEDERAL WATER RIGHTS: A COMMON DENOMINATOR OF PROPOSALS FOR CHANGE,
Department of Justice, Washington, D.C. Land and Natural Resources Div.
W. Kiechel, Jr.
Conference 'Water Law Issues--'75', Section of Natural Resources Law, ABA, Denver, Colorado, February, 1975. 15 p.

Descriptors: *Reservation Doctrine, *Federal jurisdiction, *Federal-state water rights conflicts, *State jurisdiction, Water rights, Water law, Water, Water control, Legislation, Water utilization.
Identifiers: *Sovereign immunity, *Citizen suits, *Standing(Legal).

This speech analyzes a bill which would require the inventorying and quantification of federally reserved rights to bodies of water. The United States owns the right to use the waters upon, within, and adjacent to the public domain which have not previously been appropriated by others under authority of an act of Congress. When public lands are withdrawn or reserved for authorized purposes requiring the use of water, the United States also reserves the right to use a sufficient amount of the unappropriated waters pertaining thereto to accomplish such purposes. These 'reserved rights' have been the subject of criticism and controversy and have created a great deal of friction between state and federal agencies. To alleviate these problems, the proposed legislation would require, inter alia, the head of each federal agency within five years after enactment to prepare an inventory of all reserved, appropriative, and other water rights under the administrative juridsdiction of that agency within each state. The bill further authorizes the maintenance of suits against the United States for judicial review of the rights listed in the inventorial and of administrative determinations in their listing and quantifications. Such review can be accomplished without resort to general adjudication proceedings. The author contends that the process of inventory and quantification, with judicial review of the nature described, is preferable to general judicial proceedings in state courts for purposes of removing the 'mystery' which has cloaked the federal reserved rights doctrine in the past. IMPROVEMENT OF THE QUALITY OF WATER SUPPLY SOURCES (POLICY STATE-

MENT OF AMERICAN WATER WORKS ASSOCIATION).
Journal of the American Water Works Association, Vol 67, No 8, p A19-A20, Aug. 1975, 2 p.

Descriptors: *Water resources development, *Water supply, *Water quality control, *State governments, *Planning, Water purification, Water quality standards, Costs, Industrial water, Beneficial use, Water allocation(Policy), Priorities, Research and Development, Administration, Federal government, Education, Recreation, Water utilization, Water demand.
Identifiers: State policy.

Protection and improvement of industrial and municipal water supplies is the goal of the American Water Works Association Journal. Enhancement of the economic value of water for industrial use, and safeguarding of the sanitary and aesthetic value of domestic water, cannot be achieved by effluent limitations alone. Careful planning is of paramount importance. Furthermore, state governments should have primary responsibility for water quality control, since nationwide discharge standards are unrealistic and uneconomical. However, continuing federal financial assistance will be necessary for some states. Other proposals include: (1) greater use of water quality improvement techniques such as low flow augmentation, watershed management, and control of saline water sources; (2) intensification of research and development efforts, especially in the area of physiological effects of contaminants; (3) strengthening of programs to train personnel for the water supply industry; and (4) education of the public in more efficient methods of water usage. CAN NEW YORK'S WETLANDS BE SAVED. A CONSTITUTIONAL AND COMMON LAW SOLUTION,
J. L. Stockholm.
Albany Law Review, Vol 39, No 3, p 451-493, 1975. 42 p, 299 ref, 1 append.

Descriptors: *Wetlands, *Constitutional law, *New York, *Land use, *Ownership of beds, Legislation, Water law, Conservation, Aquatic environment, Regulation, Land management, Land resources, Non-structural alternatives, Land classification, Marshes, Water injury, State governments, Federal government, Judicial decisions.
Identifiers: Fifth Amendment, Police power.

New York passed a Tidal Wetlands Act in 1973 placing a temporary moratorium on all development in the wetlands until land use regulations are issued. Because the fragile nature of the wetlands requires that strict use limitations be imposed to protect them, a fifth amendment 'taking' challenge will likely follow the issuance of the regulations. This comment attempts to anticipate that challenge and show how the Act and its regulations can be upheld. It first examines the extent of the state's interest in protecting the wetlands and the necessity of finding some valid method of conservation. Then the history of the fifth amendment taking clause is surveyed, as well as factors which will play a vital role in balancing whether the regulations are a valid exercise of the state's police power or whether they constitute a 'taking'. Finally, a review is made of the state's property interests in the wetlands and some proposals advanced concerning the courses of action available to the state. One additional factor the state must take into consideration is the 1975 Supreme Court decision in United States v Maine in which the federal government was declared to have paramount right and title to the seabeds beyond the three - mile limit. (Hoffman-Florida)

INTERNATIONAL STRAITS: THE RIGHT OF ACCESS,
Army Staff Judge Advocate's Office, Berlin (Germany).
R. P. Cundick.
Georgia Journal of Inter and Comp Law, Vol 5, No 1, p 107-140, 1975, 34 p, 102 ref.

Descriptors: *Access routes, *Navigation, *Straits, *International law, *Coasts, Channels, Inland waterways, Law of the sea, Military aspects, Navigable waters, Reasonable use, Foreign trade, International waters, Ships, Treaties, Conferences, Foreign countries.
Identifiers: International conferences, Territorial seas, Innocent passage, Free passage.

The expansion of claims to the territorial sea by coastal states has caused serious problems concerning the right of access to international straits. The proposals attempting to address these problems fall into two general categories: those advocating an innocent passage regime, and those advocating a free passage regime. Innocent passage, applicable within the territorial sea of a state, permits transit only by above water vessels which do not threaten the peace and security of the coastal state. Free passage permits navigation by all vessels and aircraft, without distinction. This article analyzes the varying effects these two approaches would have on various problems including: (1) sovereignty and access respecting the sea; (2) access to ports; and (3) access from high seas to high seas. Also presented are historical data on numerous international conferences, treaties, and special agreements which have dealt with the problem of free access. Most of these conferences and treaties have shown a trend toward greater freedom of access. (Hoffman-Florida)

DEEPSEA ADVENTURES: GROTIUS REVISITED (PRIVATE CORP. CLAIM TO DEEPSEA MINERAL RIGHTS),
Inter American Development Bank Washington, D.C. Legal Dept.
G. Biggs.
International Lawyer, Vol 9, No 2, p 271-281, 1975, 11 p, 22 ref.

Descriptors: *Law of the Sea, *Jurisdiction, *International law, *Exploitation, *Continental shelf, Natural resources, Mining, Leases, Exploration, Leases, Withdrawal, Mexico, Oceans, Water utilization, Consumptive use, Economics, Beds, Ownership of beds, Boundary disputes, Foreign countries, United States, Exploration, Manganese.
Identifiers: *Coastal states, *Mineral deposits.

Several important issues are raised by the claim of Deepsea Ventures, Inc. to exclusive mining rights on the eastern Pacific Ocean some 1,300 kilometers off the coast of Mexico. Deepsea has filed two documents with the Secretary of State of the United States; a Notice of Discovery and Claim of Exclusive Mining Rights, and a Request for Diplomatic Protection and Protection of Investments. In these documents Deepsea asserts exclusive rights to develop and mine the deposit and to take, use and sell all metals derived therefrom. One of the legal premises for Deepsea's claim is a positive rule of international law which permits the acquisition of exclusive rights to explore and exploit manganese nodules in the seabed beyond national jurisdiction. Diplomatic protection, however, is necessary for the preservation and exercise of such rights. Furthermore, Deepsea contends its claim is supported by the Convention on the High Seas which specified exploitation of resources on the abyssal ocean floor to be a freedom recognized by general principles of international law. The author disputes the validity of Deepsea's claim and presents evidence rebutting its argument. (Hoffman-Florida)

LOCAL REAPPORTIONMENT: THE EXEMPTION OF WATER MANAGEMENT DISTRICTS,
Virginia Polytechnic and State Univ., Blacksburg. Dept. of Political Science.
P. L. Martin.
Santa Clara Lawyer, Vol 14, No 1, p 31-45, 1974, 15 p, 97 ref.

Descriptors: *Constitutional law, *Water districts, *Public utility districts, *Government, *Population, Judicial decisions, Water law, Legislative review, Watershed management, Economics, Density, Drainage districts, Legal aspects, Institutional constraints, Political aspects, State government.
Identifiers: Reapportionment, Elections.

In Reynolds v Sims, the Supreme Court declared that in accord with the Constitution a state must make 'an honest and good faith effort to construct districts in both houses of its legislature, as nearly of equal population as is practicable.' Subsequent decisions, however, left room for equal apportionment exemptions. These decisions recognized that there might be some cases in which a State elects certain functionaries whose duties are so far removed from normal governmental activities and whose effects on different groups are so disproportionate that a popular election in compliance with Reynolds might not be required. Two recent Supreme Court decisions found such an exemption applicable. In one, a water management district was classified as a government of special powers because it did not perform normal governmental duties. The Court also found the financial burden of the district to be distributed in the same manner as the right to vote. In the other case, the Court upheld a statue allowing a watershed improvement district referendum permitting only landowners in the affected area to vote. The while the 'one person, one vote' philosophy pervades all levels of government, variations of local apportionment have been approved in the past and will continue to raise questions about representation in the future, especially in areas of ecological concern. MORELAND V ACADIAN MOBILE HOMES PARK, INCORPORATED (INTERFERANCE WITH NATURAL DRAINAGE).
313 So, 2d 877-86 (La. App 1975), 10 p.

Descriptors: *Louisiana, *Judicial decisions, *Drainage systems, *Penalties(Legal), *Sewage effluents, Legal aspects, Water law, Drainage, Controlled drainage, Drainage engineering, Drainage water, Drainage effects, Water control, Water conveyance, Discharge(Water), Effluents, Sewage disposal, Conveyance structures, Competing uses.
Identifiers: Injunctive relief, Swales, Servitudes.

Plaintiff homeowners brought an action against defendant mobile home park for damages and to enjoin defendant from discharging effluents into a drainage swale running through plaintiffs' property. The effluents were discharged from a sewage disposal system installed in connection with the mobile home park. Defendant contended that no alteration was made in the natural drain running across its property, and that it was impossible for defendant to restrict its use of the natural drain so as to comply with plaintiffs' demands. The Second Circuit Court of Appeal of Louisiana held that, while under Louisiana law, a servitude is created when the estate situated below receives waters running naturally from the estate situated above, the installation of the sewage disposal plant on defendant's property constituted a substantial change in the nature of the servitude, rendering it more burdensome to plaintiffs. However, since the effluent had no odor and presented no health hazard, damages rather than injunctive relief was the appropriate remedy. (Nursey-Florida)

GENE B. GLICK COMPANY, INC. V MARION CONSTRUCTION CORP. (DISCHARGE OF WATER FROM UPPER WATERSHED).
331 N.E. 2d. p 26-39 (Indiana, Court of Appeals 1975), 14 p.

Descriptors: *Indiana, *Judicial decisions, *Drainage systems, *Drainage effects, *Penalties(Legal), Legal aspects, Water law, State governments, Controlled drainage, Drainage water, Ditches, Sewers, Water control, Water conveyance, Discharge(Water), Subsurface drainage, Drainage engineering.
Identifiers: Injunctions(Mandatory).

Plaintiff, owners of lower lands, brought an action seeking injunctive relief and damage for the discharge of water from an upper watershed area. Defendant subdivision developer had established, by a system of interconnected ditches and subterranean storm sewers, a drainage system which concentrated the discharge of drainage from the upper watershed area onto plaintiffs' land causing flooding in this lower land. The First District Court of Appeals of Indiana held that, although the owner of the upper watershed could properly collect normal quantities of water which fill on his land and direct them to channels on his property, he could not direct the concentrated waters to a point where no natural watercourse existed, or so increase flowage as to cause damage to lower property. The court held that the increased drainage flow caused permanent injury to plaintiffs' property and, therefore, monetary damages was the proper legal remedy. (Nursey-Florida)

SUN ENTERPRISES, LTD V TRAIN (DREDGING AND SEWAGE DISPOSAL IN WETLANDS).
394 F Supp. 211-25 (S.D. New York, 1975), 15 p.

Descriptors: *Sewage disposal, *Wetlands, *Permits, *Federal Water Pollution Control Act, *Administrative decisions, Environmental effects, Judicial decisions, Dredging, Regulation, Administrative agencies, Adjudication procedure, Water law, Navigable waters, Water pollution sources, Sewage effluents, Jurisdiction.
Identifiers: Development projects, Administrative authority.

A real estate developer was issued a permit by the Environmental Protection Agency authorizing the discharge of sewage treatment effluent into state waters. Subsequent to the issuance of the permit, plaintiff wetland owners brought this action against the developer and particular government officials seeking various forms of relief from the dredging and sewage disposal activities of the developer. The court dismissed all claims against the government officials, finding that they did not violate any of their duties in issuing the permit under the Federal Water Pollution Control Act (FWPCA). The court, however, allowed to stand a claim for relief against the developer for discharging dredged or fill materials into waters of the U.S. without a Corp of Engineers permit in violation of the FWPCA. The developer asked for a dismissal of the claim, contending that the permit was not required because the receiving body was not a 'navigable water' as required by the Act. The court held that the purposes of the FWPCA require 'navigable waters' to be broadly defined so as to include all water bodies for water quality purposes. Thus, the traditional narrow definition of 'navigable waters' was held not to be controlling when applied to the FWPCA. (Hoffman-Florida)
W76-01976

UNITED STATES V RESERVE MINING COMPANY (DISCHARGE OF TACONITE TAILINGS INTO LAKE SUPERIOR).
394 F Supp 233-45 (D. Minnesota, 1974), 13 p.

Descriptors: *Mine wastes, *Minnesota, *Navigation, *Judicial decisions, *Permits, Water pollution sources, Water pollution effects, Public health, Environmental effects, Legal aspects, Regulation, Navigable waters, Water quality control, Water quality standards, Law enforcement, Water policy, Mineral industry, State government, Federal government, United States.
Identifiers: Refuse Act, Estoppel.

The United States and various state plaintiffs brought this action charging defendant mining company with statutory violations of the Refuse Act arising out of defendant's discharge of taconite tailings into Lake Superior. Since defendant had a Refuse Act permit, the major issue was whether the terms of the permit sanctioned the specific conduct that was challanged by plaintiffs. The Refuse Act had been consistently construed to be applicable only to those discharges impeding navigation. Recently, however, courts have given the Act a broader construction and extended its coverage to discharges that are harmful without respect to their effect on navigability. Following this trend, the court found that defendant's discharges were not sanctioned by the Act. Nevertheless, defendant contended that the principles of estoppel should preclude plaintiffs' claim, since defendant's permit was reissued in 1960 when the prevailing view that the only proper consideration under the Refuse Act was the effect a particular discharge might have on navigability. The court held, however, that the government's claim was not estoppel because of the issuance of the permit. In so holding, the court took judicial notice of public health considerations and various other factors. (Hoffman-Florida)

P F Z PROPERTIES, INC V TRAIN (DREDGING AND DEVELOPMENT OF MANGROVE WETLANDS).
393 F Supp, 1370-1382 (D DC 1975), 13 p.

Descriptors: *Federal Water Pollution Control Act, *Navigable waters, *Dredging, *Mangrove swamps, *Permits, Legislation, Wetlands, Environmental effects, Legal aspects, Jurisdiction,

Water law, Water pollution sources, Balance of nature, Judicial decisions, Classification, Construction, Landfills.
Identifiers: Biological productivity, Injunctions.

Plaintiff developer was dredging and filling mangrove wetlands in order to construct an apartment complex when charged with violation of the Federal Water Pollution Control Act (FWPCA) for discharging dredged materials into waters of the U.S. without a permit from the Environmental Protection Agency (EPA). Plaintiff brought this action for declaratory and injunctive relief against the Administrator of the EPA, contending that the mangrove wetlands were not 'waters of the U.S.' within the meaning of the FWPCA, and thus not subject to the Act's permit requirements. Defendants relied on three grounds in asserting jurisdiction over the wetlands. First, they asserted that the wetlands were navigable waters of the U.S. by virtue of a canal extending through them which was used for commercial purposes in the past. Second, they asserted that the wetlands were 'waters of the U. S.' because of the biological productivity and importance of the area. Finally, the wetland waters are a potential source from which pollutants may flow into recogined navigable waters. The court, finding all three assertions to be supported by the evidence, held that plaintiff's development was subject to the permit requirements of the FWPCA and denied any relief. (Hoffman-Florida)

CHOCTAW NATION V CHEROKEE NATION (DISPUTE OVER TITLE TO BED OF ARKANAS RIVER).
393 F Supp, 224-246, (ED Okla 1975), 23 p.

Descriptors: *Oklahoma, *Treaties, *Ownership of beds, *Boundary disputes, *Indian reservations, Judicial decisions, Legal review, Beds under water, Legal aspects, Governmental interrelations, Adjacent land owners, Boundaries(Property), Water law, Water rights, Common law, Riparian lands, Non-navigable waters, Common law, Rivers, Beds.
Identifiers: *Arkansas River(Title to bed).

Suit was brought to quiet title to a designated stretch of the natural bed of the Arkansas river. Plaintiff Choctaw and Chickasaw Nations contended that they owned an undivided interest in the entire bed. Defendant Cherokee Nation, while conceding that plaintiffs owned the south half of the bed, contended that it owned the north half of the bed. At trial the case centered around the interpretation of numerous treaties between the United States and the Indian Nations. One of the major issues was whether the bed of the river was conveyed in grants which used the Arkansas river as a boundary. The court found that when the United States disposes of riparian lands, and no intent to restrict the conveyance to lands ending at the bank is shown, and lands are not within a state, then what the grant conveys is to be determined according to common law principles and Supreme Court decisions. The court then found that the common law and decisional rule is that a grant bounded by a non-navigable stream carries right and title to the center of the stream, absent a clear intention otherwise. Applying this rule to the treaties involved, the court found the defendants to be owner of the north half of the bed. (Hoffman-Florida)

NATURAL RESOURCES DEFENSE COUNCIL, INCORPORATED V CALLAWAY (ACTION TO REQUIRE CORPS OF ENGINEERS TO ISSUE REGULATORY DEFINITION OF 'WATERS OF THE UNITED STATES').
392 F Supp. 685-86 (D. District of Columbia, 1975). 2 p.

Descriptors: *Federal Water Pollution Control Act, *Watercourses(Legal aspects), *Navigable waters, *Administrative decisions, *Judicial decisions, Legislation, Water law, Regulation, Adjudication procedure, Federal jurisdiction, Legal aspects, Classification, United States, Federal government.
Identifiers: Judicial interpretations, Judicial definitions, Territorial seas, FWPCA Amendments of 1972.

Conservation groups brought this action against the Secretary of the Army, the Army Corps of Engineers, and the Environmental Protection Agency, protesting regulations issued defining 'navigable waters' under the Federal Water Pollution Control Act (FWPCA) as those which have been, are, or may be used for interstate or foreign commerce. Plaintiffs contended that defendants acted unlawfully and in derogation of their duties under the FWPCA in giving 'navigable waters' such a narrow definition. The court granted plaintiffs summary judgement, finding that Congress, by defining the term 'navigable waters' for purposes of the FWPCA Amendments to mean 'the waters of the United States, including the territorial seas', asserted federal jurisdiction over the nation's waters to the maximum extent permissible under the commerce clause. Thus, as used in the FWPCA, the term 'navigable waters' is not limited to the traditional tests of navigability. (Hoffman-Florida)

COMMITTEE TO SAVE LAKE MURRAY V. FEDERAL POWER COMM'N (DISCHARGE OF TREATED EFFLUENT INTO LAKE).
515 F 2d, 379-385 (DC Cir 1975), 7 p.

Descriptors: *South Carolina, *Easements, *Administrative agencies, *Public utilities, *Administrative decisions, *Federal power act, Legal review, Jurisdiction, Navigable waters, Permits, Lakes, Public lands, Legal aspects, Environmental effects, Dams, Public rights, Judicial decisions, Littoral.
Identifiers: Environmental impact statement, Navigable capacity, Public hearings, *Lake Murray(SC).

Petitioners, owners of a residence adjacent to a lake, sought review of an order of the Federal Power Commission approving the application of a public utility for an easement to allow a private developer to lay pipe along a lake bottom for the discharge of treated effluent. The Commission had jurisdiction over the lake since it was created by a dam on a river which has a future navigable capacity. The issues presented at trial were (1) whether the Commission acted within its statutory authority in granting the order, (2) whether the order was based upon substantial evidence, (3) whether an easement can be granted to a private developer; and (4) whether or not a public hearing should have been held prior to granting the easement. The court upheld the Commission's order, finding that the Commission had acted within its statutory authority as granted by Section 4 (e) of the Federal Power Act, and that the easement could be granted to a private developer since it would not shift the use of the lake from public to private use. The court held that public hearings were unnecessary and that the environmental impact statement prepared supported the Commission's decision. (Hoffman-Florida)
W76-01981

UNITED STATES V. SUNSET COVE (FILL MATERIAL DEPOSITED ON MIGRATORY SANDSPIT).
514 F 2d, 1089-1090 (9th Cir 1975), 2 p.

Descriptors: *Sandspits, *Land forming, *Riprap, *Bank stabilization, *Judicial decisions, Shoals, Sandbars, *Shallow water, Erosion control, Stream stabilization, Structures, Coasts, Legal review, Watercourse(Legal aspects), Permits, Environmental effects, *Oregon, United States.
Identifiers: *Sandspit stabilization.

Defendant developer had sought to stabiliz sandspit against further erosion and seaso movement by the emplacement of a riprap and filling and elevating the surface to create build sites. The lower court ordered removal of riprap, since it had been placed there without p mit and defendent appealed. The court of App found that, because of the seaonal movemen the channel and the migratory nature of the sh and sandbars within the area of its confluence the sea, the sandspit has a natural tendency to pand and retract up and down the coast. Thus, defendants attempts at stabilizing the sand would have effected permanent changes in river channel and its course. Such changes staturtorily prohibited without an Army Corp Engineers permit. As a result of these findings lower court decision was affirmed. The re granted was modified, however, so that the def dant was required to remove only as much of riprap as would permit nature, in a reasona period of time, to take its course and reestab former topographic conditions. (Hoffman-Flor

UNITED STATES V. ALASKA (STATUS AND TITLE TO COOK INLET).
95 S CT 2240-2253 (1975), 14 p.

Descriptors: *Alaska, *Bays, *Inlets, *Fede State Water Rights Conflicts, *Judicial decisio Legal review, Leases, Oil, Ownership of b Beds under water, Legal aspects, Governme interrelations, Water law, Beds, State gov ments, Boundary disputes, History.
Identifiers: Historic bays, Gas and Oil lea Sovereignty, *Cook Inlet(Alas).

The United States, contending that the lower i to Cook Inlet constituted high seas, brought against the State of Alaska to quiet title and to join Alaska from offering oil and gas leases sale in the area. The decision in favor of Ala was affirmed by the District Court, whereu this appeal was made to the Supreme Court. central issue was whether or not Cook Inlet i historic bay. If it is an historic bay, then the S has sovereignty over the subsurface lands; if not, then the United States has paramount rig To establish historic bay status the claiming na must have exercised continuous authority over area, and foreign states must have acquiesce the exercise of the authority. In reviewing Court of Appeals decision, the Court divided findings on the exercise of authority over the I into three time periods; that of Russian sovere ty, that of the United States sovereignty, and of Alaskan statehood. After reviewing evidence, the Supreme Court reversed, find that the evidence offered by the State was not ficient to establish historic title. (Hoffm Florida)

WATER CONTROL (REGULATING POLLUTION AND DISCHARGE OF UNTREATED WASTES INTO MISSISSIPPI RIVER).
La Rev Stat secs 56:1431 thru 56:1463 (Supp 1973), 5p.

Descriptors: *Louisiana, *Water pollution control, *Aquatic habitats, *Mississippi River, Water pollution, Legislation, Water quality control, Pollutants, Water quality standards, Water pollution effects, Penalties(Legal), Law enforcement.
Identifiers: Statutory penalties.

Chapter 3, Water Control, establish a Stream Control Commission of Louisiana which is authorized to issue orders and regulations to provide protection for the various water bodies and aquatic life within the state. The Commission is authorized to bring civil actions against any person who negligently or willfully causes pollution of state waters in such concentration as to render the water unfit for maintenance of normal fish or aquatic life characteristics. Chapter 3 also prohibits the knowing discharge of any substance into a state water body which results in pollution. Standards are set up for determining what constitutes water pollution, and provides civil penalties for anyone who transcends them. The chapter specifically prohibits the discharge of any untreated waste into any public body of water in the state. It also provides that any discharged waste shall receive the best practical secondary treatment or its equivalent. Otherwise the offender will be liable for a statutory penalty for each day during which the violation occurred. (Hoffman-Florida)

CITIES SERVICE COMPANY V. STATE OF FLORIDA (ACTION BY STATE FOR DAMAGES AND INJUNCTIVE RELIEF ARISING OUT OF BREAK IN DAM IMPOUNDING PHOSPHATE SLIME).
312 So 2d 799-804 (2d District Court of Appeal of Florida, 1975), 5 p.

Descriptors: *Phosphates, *Florida, *Dam failure, *Fishkill, *Settling basins, Judicial decisions, Legal review, Penalties(Legal), Disasters, Reservoirs, Water pollution sources, Water pollution effects, Water pollution, Land use, Accidents, Water quality control, Rupturing, Damages.
Identifiers: Strict liability.

In 1971 a dam break occurred in one of appellant's settling ponds operated in conjunction with its phosphate mine. As a result, approximately one billion gallons of phosphate slimes contained therein escaped into state waters, killing countless numbers of fish and inflicting other damage. The state subsequently filed suit seeking adjunctive relief as well as compensatory and punitive damages arising out of the dam break. The trial court struck the claim for punitive damages but granted the state's motion for partial summary judgement on liability. The premise of the order was that the defendant was liable without regard to negligence or fault for the damage occurring by reason of the escape of the phosphate wastes into state waters. On appeal, the court affirmed the lower court decision. The Court of Appeal held that the doctrine of strict liability for damage resulting from the non-natural use of land should apply in Florida and that a phosphate slime reservoir constitutes such a non-natural us of land. FALCO V. JAMES PETER ASSOCIATES, INC. (ACTION BY CONTINGUOUS LANDOWNERS FOR DAMAGES AND INJUNCTIVE RELIEF ARISING OUT OF ALLEGED CHANGE OF NATURAL FLOW OF SURFACE WATER).
335 A 2d, 301-303, (Sup ct Conn 1973), 3 p.

Descriptors: *Connecticut, *Judicial decisions, *Real property, *Damages, *Surface drainage, *Land fill, Retaining walls, Penalties(Legal), Damages, Legal aspects, Land appraisals, Value, Property value, Salvage value, Economic impact, Flow, Repairing, Replacement costs, Surface waters, Surface runoff, Value.
Identifiers: Natural water flow.

Defendant property owners' predecessor in title had erected an apartment complex requiring extensive landfill. This landfill altered the natural flow of water, causing water to flow onto plaintiffs' land instead of away from it. At trial the state referee found defendants had maintained their premises so as to continue damaging plaintiffs' land. He found that a solution to the problem would be the construction of a retaining wall and a French drain; that the cost of the wall and drain would be $9000; and that plaintiffs were entitled to a judgement for the amount plus $100 nominal damages. The measure of damages, the court said, should be the dimunition in value determinable from the cost of repairing damage. Such cost may neither exceed the former value of the land nor enhance the value of the property over what it was before damage occurred. In this case no evidence was shown concerning the prior value of the plaintiffs' land. Furthermore, before damages can be awarded, it must be shown that defendants had been given notice of the condition and had refused to correct it. (Hoffman-Florida)

SOCIETY FOR PROTECTION OF NEW HAMPSHIRE FORESTS V. SITE EVALUATION COMMITTEE (APPEAL BY GROUP OPPOSING LOCATION OF NUCLEAR GENERATING FACILITY ALLEGING ADVERSE AFFECT ON WATER QUALITY).
337 A2d 773-90 (Supreme Court of New Hampshire, 1975), 8 p.

Descriptors: *New Hampshire, *Nuclear power plants, *Sites, *Administrative agencies, *Administrative decisions, Land use, Regulation, State governments, Adjudication procedure, Environmental effects, Thermal pollution, Judicial decisions, Water management(Applied), Water policy, Administration, Permits, Legal aspects.
Identifiers: Administrative findings, Subdelegation(Administrative agencies).

Opponents of a nuclear generating facility appealed from the decision of the site evaluation committee, a state administrative agency, approving the location of a facility in Seabrook, New Hampshire. Two of the issues presented were: whether the committee subdelegated its duty to ascertain the impact on water quality by the proposed facility's dishcarge of cooling water in violation of a state statute; and whether the findings of the committee were legally sufficient. The court found that no subdelegation had occurred since the site evaluation committee and the water supply and pollution control commission each fulfilled separate but coordinated functions in the authorization of the Seabrook site. As to the legal sufficiency of the findings, however, the court remanded the case for the purpose of requiring the site evaluation committee to provide basic finding of fact on the existing record to support the ultimate conclusions it has reached. The court found that where the need for new sources may adversely affect the environment, the determination of whether administrative findings are sufficient entails weighing the competing value of administrative efficiency against the need for deliberate and considered decision making. In this case, considered decision making was found to require the production of basic findings of fact. (Hoffman-Florida)

ULLIAN V. CULLEN (APPEAL FROM DECISION RESTRAINING OBSTRUCTION OF A WATERCOURSE CARRYING FLOW OF SUR-

FACE WATER FROM ADJOINING PROPERTY).
325 NE2d 593-97, (Appeal Court of Massachusetts, 1975), 5 p.

Descriptors: *Watercourses(Legal aspects), *Surface drainage, *Surface runoff, *Massachusetts, *Natural streams, Culverts, Judicial decisions, Legal review, Landfills, Penalties(Legal), Floods, Developed waters, Outlet works, Conveyance structures, Adjacent land owners, Easements, Artificial watercourses, Rainfall-runoff relationships.

Defendants, during a landfill operation, blocked a culvert opening located on their property. Following the blockage of the culvert, water backed up from the area near the culvert and flooded parts of plaintiff's property. At trial, a master found that the culvert had constituted a well-defined watercourse. The trial judge confirmed the master's report and entered a decree ordering defendants to unblock and reconstruct the alleged watercourse and to grant plaintiff an easement to maintain the watercourse as reconstructed. On appeal, the Appeals Court found that the master's report contained no finding as to the source of the alleged waterflow other than the drainage of surface water from adjoining property. For a culvert to be a natural watercourse it must appear that to be something more than an artificial ditch for carrying off surface water and draining the land through which it passes. The court found no such evidence in the master's report. Thus the decree was reversed, and the case remanded. (Hoffman-Florida)

MARINE POLLUTION-PREVENTION-WASTES, ETC.
PL 93-254; 88 stat 50, US Code Cong and Admin News, p 49-50, 1974, 2 p.

Descriptors: *Transportation, *Oceans, *Waste disposal, *Water pollution sources, *Ships, Water pollution, Legislation, Water pollution control, Pollutants, Water quality control, Abatement, Solid wastes, Ultimate disposal, Wastes, United States, Foreign countries, Navigation.
Identifiers: *Territorial sea.

This Act amends the Marine Protection, Research, and Sanctuaries Act of 1972, in order to implement the provisions of the Convention on the Prevention of Marine Pollution by Dumping of Wastes and Other Matter. These amendments provide that the purpose of the 1972 Act is to regulate: (1) the transportation by any person of material from the United States and, in the case of United States vessels, aircraft, or agencies, the transportation of material from a location outside the United States, when in either case the transportation is for the purpose of dumping the material into ocean water; and (2) the dumping of materials transported by any persom from a location outside the United States, if the dumping occurs in the territorial sea or the contiguous zone of the United States. Also presented are various other technical amendments to the 1972 Act. (Hoffman-Florida)
W76-01992

BURGESS MINING AND CONSTRUCTION CORPORATION V. STATE EX REL BAXLEY (ACTION BY STATE FOR DAMAGES RESULTING FROM MINING COMPANY'S ALLEGED POLLUTING OF RIVER).
312 So 2d 842-48 (Civil Appeals of Alabama, 1975), 7 p.

Descriptors: *Alabama, *Mine wastes, *Water quality standards, *Judicial decisions, *Permits, Legal aspects, State jurisdiction, Administrative agencies, Regulation, Water pollution sources, Industrial wastes, Environmental effects, Aquatic life, Penalties(Legal), Waste water treatment, Rivers, Recreation.

The State brought an action to recovery civil penalties from defendant mining company which was allegedly polluting a river without first obtaining a permit. From a judgement in favor of the State, the defendant appealed. Defendant contended that there was insufficient evidence of the pollution charge to sustain the verdict, since there was no showing that the defendant violated any standard established by the Alabama Water Improvement Commission. The court rejected this contention, noting that the complaint against defendant was not for a violation of water quality standards but for the pollution of the river without a permit. The court ruled that defendant had discharged matter into the river without a permit and that such material was pollution as defined by Alabama Water Improvement Act, and was harmful to aquatic life and detrimental to the recreational use of the river. Thus, it was not necessary for the State to introduce proof showing violations of water quality standards set by the Commission. The court noted, however, that evidence offered to show compliance with established criteria of water standards would have been a defense to the charge of pollution. (Hoffman-Florida)

WARNER V. REPLINGER ('BAY' DEFINITION).
397 F Supp 350-60 (DRI 1975), 11 p.

Descriptors: *Northeast U.S., *Bays, *State jurisdiction, *Federal jurisdication, *International waters, Legal aspects, Legal review, Inlets(Waterways), Federal-state water rights, Conflicts, Navigable waters, Administrative agencies, Water rights, Coasts, Ajudication procedure, Judicial decisions, Federal government, State governments.
Identifiers: Administrative regulations, Coastal waters, Licenses, Standing(Legal).

Plaintiffs, Connecticut pilots, sought declaratory and injunctive relief challenging a Rhode Island statute requiring pilots in Block Island Sound to have Rhode Island licenses. Plaintiffs contended that the Congressional test for a 'bay', in which the area of the bay is compared to the area covered by a semi-circle whose diameter is equal to the entrance points to the bay, established that Block Island Sound did not constitute a bay and therefore should not be regulated by the Rhode Island statute. Plaintiffs further contended that ship routes in the Sound lay more than three miles off shore, and thus beyond state authority. In denying the plaintiffs their requested relief, the District Court noted that there is no question of the federal government's control over navigable waters and that by statute the federal government has delegated regulations of certain navigable waters to the states. The Court also held that Block Island Sound is a 'bay' within the federal statutes granting states authority to regulate pilots in bays. (Gray-Florida)

MMONWEALTH, DEPARTMENT OF HWAYS V. JENT (NO LOSS OF REASONA- ACCESS TO HIGHWAY BECAUSE OF ANGE IN SURFACE WATER DRAINAGE).
SW2d 121-123 (Ky Ct App 1975), 3 p.

criptors: *Kentucky, *Highway effects, ainage effects, *Surface waters, oundwater, Groundwater movement, inage, Drainage area, Construction, Ditches, ess routes, Properties, Property values, Right- vay, Legal aspects, Legal review, Drainage erns(Geologic), Damages, Judicial decisions.
tifiers: Nuisance, Proximate causation, hway access.

ntiff landowners brought an inverse con- nation proceeding claiming that construction onnector roads by defendant, Department of hways, had altered surface water drainage on their property and deprived them of reasonable access to the highway. Plaintiffs also contended their properties had been directly damaged by water flow, deminishing its value. In reversing a trial court decision for plaintiffs, the Court of Appeals of Kentucky noted that property owners who allege a decrease in property value due to construction-caused water flow must offer proof of the resulting damages, even if it is conceded that negligent construction caused the water flow. Furthermore, the lack of access to highways on infrequent occasions does not constitute a loss of reasonable access. (Gray-Florida)

WERNBERG V. STATE (COMPENSATION FOR OBSTRUCTION OF RIPARIAN PROPRIETOR'S ACCESS TO INLET).
519 P2d 801-804 (Alaska, 1974), 4 p.

Descriptors: *Alaska, *Access routes, *Judicial decisions, *Riparian rights, *Condemnation, Streams, Inlets, Navigable waters, Water rights, State jurisdiction, Constitutional law, Regulation, Legal review, Legal aspects, Riparian land, Littoral.
Identifiers: *Littoral rights.

Plaintiff landowner had sought damages from the state in an inverse condemnation suit for the obstruction of a riparian proprietor's access from a creek to an inlet. After the trial court dismissed the complant, plaintiff appealed to the Alaska Supreme Court. In reversing, the court rejected the state's argument that there was no private littoral right to use public waters for navigation. The Court also rejected an argument that the right to limit littoral access, given to the state by the Alaska Constitution, constituted regulation. After this decision, the state filed a petition for rehearing, contending that the Court had misinterpreted the state's second argument. In denying the rehearing, the Court held that it had not misinterpreted the argument, since it agreed that the state had the right to limit a private littoral right of access. However, the Court also found that the limiting of the access was a taking, and not regulation. Thus, the award of damages was justified. (Hoffman-Florida)

FLOOD MANAGEMENT DECISIONMAKING IN THE CONNECTICUT RIVER BASIN: ANALYSIS OF THE EXISTING LEGAL, FINANCIAL AND INSTITUTIONAL FRAMEWORK FOR FLOOD PLAIN MANAGEMENT,
Meta Systems, Inc., Cambridge, Mass.
D. Smith, and S. Robinson.
Available from the National Technical Information Service, Springfield, Va 22161 as PB238-998, $5.00 in paper copy, $2.25 in microfiche. Prepared for New England River Basins Commission, Boston, Mass. 303 p, 7 fig, 3 tab, 15 ref. CRSS-NERBC 1.3F, 1.5F, 1.6F. NERBC 1.3F, 1.5F, 1.6F.

Descriptors: Water resources, *Connecticut River, *Flood control, *Non-structural alternatives, *Water management(Applied), *Governments, *Governmental interrelations, *Decision making, Flood protection, Water policy, Wetlands, Vermont, New Hampshire, Connecticut, Massachusetts, *Connecticut River.
Identifiers: Flood management, St. Johnsbury(Vermont), Keene(New Hampshire), Northampton(Mass), Flood plain management, Flood management institutions, Flood management laws, Flood management financing, Inland Wetlands Act, Open planning.

Observations of the existing financial, legal, and institutional mechanisms for flood management decisionmaking in the Connecticut River Basin as well as discussion of interest groups' influence on and interaction with these mechanisms are presented. A set of uniform legal, financial and institutional criteria for evaluating alternative flood management processes is proposed. The flood management decisionmaking structure and process for each state in the Basin, Massachusetts, Vermot, Connecticut, and New Hampshire, is discussed in relation to the state's legislative process and statutory foundation. Section 2 contained 3 case studies which examine the interest groups, local and regional agencies, geographical and historical characteristics, and political controversies unique to each community. The current role of the federal government in regional flood management is also discussed. To incorporate the range of interests into the analysis of flood management alternatives, some formal methodologies are surveyed. Some conclusions are: (1) Flood management is not an important factor in municipal decisionmaking at present in the Connecticut Basin. (2) Communications between local groups who often have a vast store of valuable knowledge and state and federal agencies are inadequate. (3) Biases of state and federal agencies and financial restraints interfere with rational planning. (Salzman-North Carolina)

PERFORMANCE CONTROLS FOR SENSITIVE LANDS: A PRACTICAL GUIDE FOR LOCAL ADMINISTRATORS,
American Society of Planning Officials, Chicago, Ill.
C. Thurow, W. Toner, and D. Erley.
Environmental Protection Agency, Report EPA-600/5-75-005, March 1975. 523 p, 25 fig. 1HA098; 21 AKL 25. R802443.

Descriptors: *Land use, Control, Data collections, Environment, Water resources, *Planning, Analytical techniques, *Performance, Administration.
Identifiers: *Planning controls.

This report is to be used as a handbook by local planning officials in planning for and regulating the use of five distinct natural areas: streams and creeks, wetlands, woodlands, hillsides, and groundwater and aquifer recharge areas. Each section is devoted to the discussion of local regulation of land use in areas identified as 'sensitive'; and each area is discussed in terms of its ecology and value to the public, current regulatory practices, and recommended programs for regulating the area. Also included are appendices showing where and how to go about getting technical assistance from existing governmental agencies and examples of local ordinances for protecting the environmentally sensitive areas. The final section is a monograph on environmental performance standards, the result of a preliminary study on the feasibility of extending the performance standard concept used in industry to regulation of the environment. Its purpose is to explore this possibility and to suggest new areas for research. (EPA)

Descriptors: *Environmental control, *Legal aspects, *Political aspects, *Planning, *Governmental interactions, *Comprehensive planning, *Social aspects, Pollution, Administration, Decision-making, Ecosystems, Data.
Identifiers: Environmental management, Environmental standards, Environmental impact statements, Ecology, Residuals, Federal environmental functions, Citizen control, Environmental Protection Agency(EPA).

For environmental policies to be effective, environmental management has to integrate knowledge from a variety of fields and disciplines including government, industry, business, economics, ecology and the general public. Contained in this report are 42 articles covering the full range of environmental management issues. These papers examine the environmental issues from varied perspectives and discuss techniques for citizen participation, management information systems, organizational structures, special regulatory procedures and controls, legal actions and other strategies for improving the environment. Several strategies explored include land use planning, environmental impact statements, and environmental standards and laws. One section examines intergovernmental relations in managing the environment. Three conclusions are reached: the shortcomings of present environmental management techniques are recognized by decision-makers at all levels of authority, sophisticated environmental concepts are found to be non-operational by the local managers, and successful management techniques are not exchanged by communities. For more effective environmental management, more emphasis should be placed on human aspects, managerial and technical assistance must be provided to implement environmental mandates at local level, and sophisticated tools already created must be molded into a more easily transferable form in order to be effective. THE WILLAMETTE RIVER GREENWAY: CULTURAL AND ENVIRONMENTAL INTERPLAY,
Oregon State Univ., Corvallis. Dept. of Anthropology.
W. D. Honey, Jr.
Available from the National Technical Information Service, Springfield, Va 22161 as PB-247 554, $6.00 in paper copy, $2.25 in microfiche. Oregon Water Resources Research Institute, Corvallis, Report WRRI-35, September 1975. 133 p, 18 fig, 31 tab, 88 ref, 2 append. OWRT B-023-ORE(5).

Descriptors: *Water quality, *Oregon, Ecology, Environmental effects, *River basin development, Technology.
Identifiers: *Cultural-ecological systems, Industrial-urban technology, *Willamette River Greenway(Ore).

The Willamette River Basin, Oregon, viewed in terms of a cultural-ecological systems, has been subject to three phases of cultural development: hunting and gathering, agrarian, and industrial-urban. Each population base has employed a technology to exploit the environment to the extent that its patterns of culture would allow. This technology has been oriented towards one relevant resource within the ecological system--the Willamette River. The environmental quality of the Willamette River began to show signs of impairment with the onset of the industrial-urban development, and the use of a more sophisticated technology. Only through the efforts of a few concerned citizens did the quality of the water begin to improve by the mid-Twentieth Century. The Willamette River Greenway as a governmental response to renew the relevant resource of the cultural-ecological system. Public attitudes toward the Greenway indicate that basin residents feel industrial-urban technology should be utilized to renew the Willamette River, allowing it to once again become the cultural focal point of the ecological system.

IN MEMORIAM: RAINBOW BRIDGE NATIONAL MONUMENT,
F. Hannay.
Ecology Law Quarterly, Vol 4, No 2, p 385-414, 1974. 29 p, 130 ref.

Descriptors: *Judicial decision, *National monuments, *National parks, *Dams, *Reservoirs, Erosion, Preservation, High water mark, Arizona, Utah, Sulfur, Powerplants, Arid lands, Structural stability, Structures, Legal aspects, Water resources development, Water level fluctuation, Desert plants, Deserts, Water storage, Arid climates.
Identifiers: *Rainbow Bridge National Monument, *Colorado River Storage Project Act, *Glen Canyon/Lake Powell Project, Congressional Acts, Bathtub ring(Reservoirs).

The nature and possibly the very existence of Rainbow Bridge National Monument has been affected by the decision of the Tenth Circuit in Friends of the Earth v. Armstrong. The decision allows the waters dammed by the Glen Canyon/Lake Powell Project to invade the monument's natural arid environment, despite the 1956 Colorado River Storage Project which specifies that no dams or reservoirs will be constructed within any national park or monument. The court gave as a reason for its ruling that the provisions of the Act had been overruled by implication and need no longer be adhered to. The author argues that the intent of Congress should be determined by Congressional action and not by judicial interpretation, especially where the decision will set a precedent for future judicially sanctioned encroachments on the National Parks and Monuments creasted by Congress. (Parrish-Florida)

THE FUTURE OF ENVIRONMENTAL DEFENSE,
Environmental Law Inst., Washington, D.C.
F. R. Anderson, and A. Rosencranz.
American Bar Association Journal, Vol 61, p 316-320, March 1975. 5 p.

Descriptors: *Environmental control, *Legal aspects, *Comprehensive planning, *Regulation, *Future planning(Projected), Projections, Adoption of practices, Construction, Federal Water Pollution Control Act, Legal review, Legislation, Pollution abatement, Judicial decision, Administrative agencies, Long-term planning, Environmental engineering.
Identifiers: *Environmental litigation, *Alaska Pipeline, *Energy policies.

Environmentalists are starting to re-evaluate the role of lawsuits in environmental defense. While such litigation has been primarily responsible for redesigning, delaying, and stopping numerous projects, the success or failure of legal challenges has too often depended on technicalities, rather than on the merits of the activities challenged. Thus there is a recognized need for implementation of comprehensive land use and energy policies. In the absence of such policies, environmental lawyers must employ non-litigative strategies, such as conferring with administrative officials, reviewing and commenting on proposed environmental regulations, and marshalling public opinion at state and local levels. These lawyers generally keep away from the legislative process, since most environmental groups have tax-exempt status under the Internal Revenue Code. The problem with these nonlitigative areas is that lawyers are accustomed to working on a case by case basis, and often do not collaborate enough to prevent duplication of effort, much less to build a coalition and establish a joint strategy. Even so, various methods and techniques are already available or being developed to aid environmental lawyers desiring broad social change under a defined national strategy. (Hoffman-Florida)

Descriptors: *Remote sensing, *Wetlands, *Coastal marshes, *Louisiana, Data processing, Automation, Satellites(Artifical), Aerial photography, Land forming, Vegetation, Aquatic plants, Forests, Water quality, Environment.
Identifiers: *ERTS, Pattern recognition, Species identification.

The evaluation was conducted in a humid swamp and marsh area of southern Louisiana. Earth Resources Technology Satellite (ERTS) digital multispectral scanner data was compared with similar data gathered by intermediate altitude aircraft. Automatic data processing was applied to several data sets to produce simulated color infrared images, analysis of single bands, thematic maps, and surface classifications. These products were used to determine the effectiveness of satellites to monitor accretion of land, locate aquatic plants, determine water characteristics, and identify marsh and forest species. The results showed that to some extent all of these can be done with satellite data. It was most effective for monitoring accretion and least effective in locating aquatic plants. The data sets used showed that the ERTS data is superior in mapping quality and accuracy to the aircraft data. However, for some applications requiring high reaolution or maximum use of intermittent clear weather conditions, data gathering by aircraft is preferable. Data processing costs for equivalent areas were about three times greater for aircraft data than ERTS data, primarily because of the larger volume of data generated by the high resolution aircraft system. SATELLITE RELAY AND PROCESSING OF HYDROLOGIC DATA IN SOUTH FLORIDA,
Geological Survey, Tallahassee, Fla.
E. T. Wimberly.
Available from the National Technical Information Service, Springfield, Va 22161, as PB-244 784, $3.25 in paper copy, $2.25 in microfiche. Water-Resources Investigations 12-75, 1975. 19 p, 9 fig, 11 ref.

Descriptors: *Remote sensing, *Hydrologic data, *Satellites(Artificial), *Florida, *Data transmission, Rainfall, Water levels, Telemetry, Data collections, Watershed management.
Identifiers: *Real-time data, NASA, LANDSAT, Big Cypress Swamp(Fla), Everglades.

A Data Collection System (DCS), using the LANDSAT Satellite (LANDSAT-1) as a data-relay platform, has been tested in south Florida. The purpose of DCS is to transmit water data to the user in near real time, even from remote areas. The flow of data is from data-collection platforms at field sites via LANDSAT-1 satellite to the National Aeronautics and Space Administration's (NASA) ground-receiving stations to the NASA Data Processing Facility at Goddard Space Flight Center to the Miami office of the U. S. Geological Survey to data users. The process requires only a few hours, and current data are provided to water-management agencies in several different forms. Thousands of square miles of south Florida are inundated many months of the year when the only practical access is by airboat or helicopter. The need for near-real-time data becomes imperative during times of crisis, such as a hurricane, because rapid evaluation of the situation and operational decisions are mandatory. In October 1972 a DCS began transmitting to the U. S. Geological Survey Office in Miami, water-level and rainfall information from gaging stations in the water-conservation areas, Everglades National Park, and Big Cypress Swamp. The time for this transmittal is about 45 minutes. (Woodward-USGS)

H. H. Gordon, M. E. Penney, and R. J. Byrne.
Available from the National Technical Information Service, Springfield, Va 22161, as N75-10566, $5.00 in paper copy, $2.25 in microfiche. Report NASA CR-137475, October 1974. 79 p, 29 fig, 5 tab, 25 ref, 2 append. NASA NAS6-1902.

Descriptors: *Remote sensing, *Wetlands, *Thermal pollution, *Virginia, Powerplants, Heated water, Satellites(Artifical), Aircraft, Salt marshes, Coasts, Seashores, Inlets(Waterways), Barrier islands, Tides, Measurement, Instrumentation, Data processing, Estuaries.

During 1973 scientists at the Virginia Institute of Marine Science (VIMS) utilized remote sensing in three programs: tonal variations in imagery of wetlands, use of the thermal infrared to delineate the discharge cooling water at the Virginia Electric and Power Company nuclear power station of the James River, and the use of aerial photography to determine the volume storage function for water in the marsh-bay complex fed by Wachapreague Inlet on the Eastern Shore of Virginia. One program was to determine the causes of tonal variations in wetlands imagery and delimit their scope. Results from a predominately single-species salt marsh show variations in tone large enough to cause confusion in an automatic mapping scheme or bioproductivity studies. Thermal infrared imagery from a scanner was used to obtain an instantaneous surface thermal map of the area. Rectification of the strip film from the scanner, thermal-spatial resolution, and the correlation of the geometrically corrected scanner output with ground recorded information is discussed. Some insights into the plume behavior are presented. (Sims-ISWS)

Descriptors: *Remote sensing, *Coasts, *Florida, Beaches, Seashores, Estuaries, Sands, Bottom sediments, Radar, Aircraft, *Mapping, Measurement, Instrumentation, On-site investigations, Strip mine wastes, Coal mines, Data collections, Data processing.

Work on this contract is divided into three tasks: (1) compositional mapping of beaches and river systems, (2) enhancement and location of bottom features with passive multispectral data, and (3) multispectral radar imaging for coastal areas. In Task I, an attempt is being made to build on the capability to discriminate silica sand beaches from other beaches through the use of the restrahlen technique. The specific focus is to obtain estimates of beach sand grain size, beach moisture content, and sorting of beach materials through the use of remote sensing indicators. These parameters are important in assessing trafficability. In Task II, the emphasis is on developing techniques for delineating bottom features, independent of water depth, using passive multispectral data. While the approaches used are similar to those for measuring water depth, further refinement of that proven capability is not a research task under this contract. In Task III, the potential utility of X and L Band synthetic radar as an all-weather beach sensor is being addressed. Because of the relatively less advanced state-of-the-art of interpretation and processing of radar data, this task has so far emphasized the digitization of radar imagery and the preparation of some promising ratio algorithms. Iowa State Univ., Ames. Dept. of Agronomy.
F. R. Troeh.
Soil Science Society of America Proceedings, Vol 39, No 4, p 707-709, July-August 1975. 4 fig, 2 tab, 5 ref.

Descriptors: *Creep, *Mass wasting, *Soils, *Slope stability, *Solifluction, *Measurement, Instrumentation, Soil density, Slopes, Strain gages, Sites, On-site tests.
Identifiers: *Soil movement, Augers.

Soil creep occurs so slowly that it is usually overlooked. Nevertheless, its persistence makes it significant to sciences that deal with soils or landscapes. Creeping soil can move landmarks and cause structures to tilt or collapse. But, the rate of movement by soil creep under various conditions is largely unknown. A sensor that measures soil creep was described. The sensor was a sheet metal structure buried in a deep auger hole. Movement detectors mounted at four depths on the sensor were coupled to indicators at the soil surface to show how much movement has occurred. Readings from such sensors identify the location, depth, and rate of soil creep. (Visocky-ISWS)

MAP SHOWING FLOOD OF APRIL 1975 AT MERIDIAN TOWNSHIP, MICHIGAN,
Geological Survey, Lansing, Mich.
R. L. Knutilla, and L. A. Swallow.
Open-file map, 1975. 2 sheets, 7 fig, 2 tab.

Descriptors: *Floods, *Maps, *Flood data, *Michigan, *Streamflow, Flow measurement, Discharge(Water), Flood damage, Aerial photography, Hydrographs, Flood peak, Peak discharge, Snowmelt, Rainfall, Flood frequency, Hydrologic data.
Identifiers: *Meridian Township(Mich), *Red Cedar River(Mich).

On April 18, 1975 between 5 p.m. and 12 p.m. Meridian Township, Michigan, experienced an intense rain storm that caused the Red Cedar River to overflow its banks resulting in extensive flooding. Damages may be as high as 6.25 million dollars. The drainage area of the Red Cedar River at the east boundary of the report area (Meridian Road) is about 315 square miles. At the west boundary (Hagadorn Road) the drainage area is about 355 square miles. Two weeks prior to the storm, about 13 inches of snow fell over most of the Red Cedar River basin. Subsequent melting caused increased streamflow. The extent of flooding along the Red Cedar River and Pine Lake Outlet is shown on the photomosaic base maps. Discharge data obtained at East Lansing are equivalent to those at the western boundary of Meridian Township. Discharge is about 10 percent lower at the eastern boundary. The discharge hydrograph for East Lansing shows the peak discharge of 5,940 cfs which occurred near midnight on April 20. This discharge is equivalent to a runoff of about 17 cfs per square mile of drainage area. The flood had a recurrence interval of about 40 years or about a 2.5 percent chance of occurrence in any year. (Woodard-USGS)

GEOLOGIC CONTROL OF SUPPLY AND QUALITY OF WATER IN THE MOUNTAINOUS PART OF JEFFERSON COUNTY, COLORADO,
Geological Survey, Denver, Colo.
W. E. Hofstra, and D. C. Hall.
Available from Colorado Geological Survey, Dept. of Natural Resources, Denver Colo., Price $3.00. Colorado Department of Natural Resources, Denver, Bulletin 36, 1975. 51 p, 42 fig, 8 tab, 54 ref.

Descriptors: *Basic data collections, *Hydrologic data, *Colorado, Surface waters, Groundwater, Water quality, Streamflow, Water wells, Aquifer characteristics.
Identifiers: *Jefferson County(Colo).

Information is presented on the availability of water for domestic supply in the mountainous area in Jefferson County, Colo. The area covered by the study is roughly 300 square miles of mountainous Jefferson County extending from Clear Creek on the north to the Pike National Forest boundary on the south and from the east edge of the Front Range mountains to the western boundary of the county. The population of the mountainous part of the county was roughly 20,000 in 1974. Hydrologic data were collected at 34 streamflow sites. Bacteriological and chemical analyses of surface waters are given for 32 sites. During the study, 31 springs and 727 wells were sampled. Comprehensive bacteriological and chemical analyses of samples collected from 38 wells and 1 spring are given. Eleven test wells drilled by air-percussion. Geologic logs and hydrologic test data for wells are given. (Woodard-USGS)

INVENTORY AND CATALOGING OF SPORT FISH AND SPORT FISH WATERS IN SOUTHEAST ALASKA,
Alaska Dept. of Fish and Game, Juneau.
A. Schmidt, and F. S. Robards.
Alaska Division of Sport Fish, Vol 16, Study G-I-A, July 1, 1974-June 30, 1975. 113 p, 31 fig, 49 tab. 59 ref.

Descriptors: *Census, *Fish populations, *Sport fish, *Alaska, *Lake fisheries, Chemical properties, Oligotrophy, Trout, Productivity, Benthic fauna, Diptera, Oligochaetes, Fish food organisms, Streams, Specific conductance, Fish stocking, Recreation, Salmon, Water temperature, Lake marphometry, Dissolved oxygen, Plankton, Zooplankton, Aquatic insects, Fish diets, Hydrogen ion concentration, Thermal stratification.
Identifiers: *Sitka(Alas), Dolly Varden char.

Limnological studies of eight southern Alaska lakes revealed limited fish production due to their oligotrophic character and lack of shoal areas. Conductivity, except in Redoubt Lake, was less than 50 micromhos. The rating of productivity, in descending order, was Swan, Blue, Osprey, Auke, De Boer, Spurt, Redoubt, and Green Lakes. Predominant bottom fauna were Chironomidae and Oligochaeta. As pH values are correlated with fish survival, many of the southeastern Alaska lakes with low temperature, soft water, and acid bog conditions are probably unsuited for rainbow trout production. Evaluation of sport fishing resources along the Sitka area road system were conducted by walking each stream and sampling with minnow traps; particular emphasis was placed upon spawning and rearing areas and any blocks to fish passage. The Sitka area saltwater creel census determined the contribution of returning coho salmon produced from the saltwater rearing pens at Starrigavan Bay. A shoreline saltwater creel census was conducted in the Auke Creek and in the Juneau area. The recreation potential of De Boer, Spurt and Swan lakes is described. Census estimates of king, coho, Pacific halibut, sockeye, pink, Dolly Varden, cutthroat, and chum taken in Auke Creek, and in the Juneau and Sitka areas are given. (Auen-Wisconsin)

8. ENGINEERING WORKS

SEWER LAYING SYSTEM,
W. R. Brown.
United States Patent 3,906,737. Issued September 23, 1975. Official Gazette of the United States Patent Office, Vol 928, No 4, p 1529, September, 1975. 1 fig.

Descriptors: *Sewers, *Sewerage, *Patents, Equipment, Installation, Tiles, Tile drains.

A tile setting piece of machinery has been patented for the laying of sewers. The apparatus consists of: a chassis trestle including parallel base rails; a pair of top rails on pillars in alignment with and above the base rails; and transverse beams connecting the respective terminal ends of both the top and base rails. A tile-bed laying car is mounted between the top rails on trolleys. One of the trolleys moves the car along the top rail. The car has side walls and end walls which form an enclosure, open at the top and bottom, to collect and pass a predetermined layer of aggregate material. The car also has a tile setting bumper projecting to the rear of the car and a push ring to engage the bell flange of a tile. A cover fill car is mounted behind the bed laying car wihtin the trestle on the trolleys. The cover fill car is also moved along the top rails, and has side and end walls, so that a predetermined layer of cover material may be released over the installed tiles. (Kramer-FIRL)

BREAKWATERS FOR LONG, SHORT AND/O COMPLEX WATER WAVES,
K. P. H. Frey
U. S. Patent No 3,908,384. 4 p. 4 fig. 9 ref. Offic Gazette of the United States Patent Office, V 938, No 5, p 2068, September 30, 1975

Descriptors: *Patents, *Breakwaters, *Coas structures, *Waves(Water), Shore protection, A tenuation
Identifiers: Dampening

This invention relates to a breakwater, especia for use where a large range of wavesteepness (i ratio of wave height to wave length) is encou tered, such as in coastal regions of oceans a large lakes. This new breakwater is a compos device and comprises two different kinds of bre waters. The first breakwater section is adapted dampen relatively short waves and/or short co ponents of a long wave. After the wave has pass this first section it encounters the second secti which is adapted to dampen long waves. T second section can effectively do this because t first section acts as a primary wave cont method. Sufficient amounts of energy have be eliminated before the transmitted wave reach the second section. The first section comprises a series of vanes the first of which is substantia below water level. The subsequent vanes progressively higher until at least one is near to above water level, and then one or more furth vanes are positioned at one or more lower lev until the last one is again substantially below wa level. The second section is a single convex s face (viewed from above) having its leading ed parallel to water level and perpendicular to the coming waves. The curved surface may be f upper side of a plate of any suitable material. curves slowly upward to its trailing edge which above water level. (Sinha-OEIS)

PRESSURE JET CLEANING OF PLASTIC INS IN SANDY SOIL,
ultural Research and Education Center, Alfred, Fla.
. Ford.
actions of the ASAE (American Society of ultural Engineers), Vol 17, No 5, p 895-897, mber-October, 1974. 3 fig, 1 tab, 6 ref.

riptors: *Jets, *Drainage practices, surface drains, Cleaning, Drains, Drainage ms, Sludge, *Florida, Agriculture, Plastic , Sands.
ifiers: *Plastic drainage pipe, Gravel en- e, Jet cleaning, Corrugated pipes.

w pressure jetting method is described for ving sludges from plastic drains and from the unding thin gravel envelope utilized in da sandy soils. There was no sand infiltration gravel envelopes 0.75 to 1.50 in thick with gated plastic polyethylene pipe employed in installations. A low pressure jet cleaning m can function in 5-to 5-in. plastic drains up 0 ft. in length where ochre and FeS are the ary deposits to be removed. Cleaning of the l envelope can be accomplished presumably e surging action of jetting pressure. Jetting ld be performed at a slow entry rate and with draulic head above the drain. In sandy areas e sludges are a problem, jetting should be per- ed within 2 weeks after initial drain flow. gerboe-Colorado State)

HYDRAULIC MODEL STUDIES OF THE TETON CANAL OUTLET WORKS ENERGY DISSIPATOR,
Bureau of Reclamation, Denver, Colo. Engineering and Research Center.
T. J. Isbester.
Available from the National Technical Information Service, Springfield, Va 22161, as PB-237 610, $4.00 in paper copy, $2.25 in microfiche. Report No REC-ERC-74-16, October 1974. 23 p, 16 fig, 8 ref.

Descriptors: *Model studies, *Energy dissipation, *Head loss, *Cavitation, *Idaho, Scaling, Hydraulic models, Canals, Outlet works, Discharge(Water), Flow, Gates.
Identifiers: *Teton(Dam).

Studies were made on a 1:5.66 scale model of a single jet-flow gate and sudden expansion energy dissipator to determine discharge coefficients for full and partial gate openings, head losses through the facility, cavitation characteristics, and the back-pressure requirements for the submerged jet-flow gate. The two-diameter expansion was inadequate and was replaced by a three-diameter section. A method of cavitation scaling was discussed whereby visible and/or aurally detectable model incipient cavitation was used to determine incipient cavitation lines for a series of single gate openings and a range of discharges from no-flow through that obtained at maximum head. Using the slope of the model line and the scale vapor pressure, the prototype incipient cavitation line was obtained. A white-pigmented concrete curing compound was found to be satisfactory for use as a cavitation indicator. (Bhownik-ISWS)

HIGH-PRESSURE WATER JET CLEANING OF SUBSURFACE DRAINS,
Agricultural Research Service, Brawley, Calif. Imperial Valley Conservation Research Center.
L. B. Grass, and L. S. Willardson.
Transactions of the ASAE (American Society of Agricultural Engineers), Vol 17, No 5, p 886-888 and 891, September-October 1974. 7 fig, 8 ref.

Descriptors: *Jets, *Drainage practices, *Hydraulic equipment, *Hydraulic machinery, Cleaning, Tile drains, High pressure, Drains, Drainage systems, Hydraulics, Subsurface drains, Agriculture.
Identifiers: *Jet cleaning.

High-pressure jetting equipment utilized the macerating action of high- velocity water jets and vigorous water turbulence to clean roots, silt, and chemical deposits from subsurface drains. Water existing from the rear jets propels the nozzle and hose up the drain. Two types of nozzles are most commonly used in Imperial Valley: (a) the cleaning nozzle used mainly for removing silt and mineral deposits requiring a pump pressure of 1250 psi and a nozzle pressure of 600 psi; and (b) the penetrator nozzle, used mainly for removing root plugs and the larger, more difficult accumulations of silt requiring pump pressure of 1000 psi and a nozzle pressure of 500 psi. A dewatering pump is used to remove the dislodged material arriving at the tile opening. The jet cleaning operation also can locate breaks in subsurface drain lines so that they can be repaired. INDUSTRIAL WASTEWATER PUMPS,
Fluor Engineers and Constructors, Inc., Houston, Tex. Process Dept.
J. A. Scher.
Chemical Engineering, Deskbook Issue, p 95-101, October 6, 1975. 6 fig, 1 tab, 7 ref.

Descriptors: *Waste water treatment, *Industrial wastes, *Pumps, Pumping, Equipment, Centrifugal pumps, Pump turbines, Hydraulic equipment, Hydraulic systems, Pistons, Water conveyance, Sumps, Hydraulic machiner.

An overview is given of the various types of pumps employed in the treatment of industrial effluents. The types of pumps include: centrifugal pumps; sump pumps; submersible pumps; positive-displacement piston pumps; diaphragm pumps; rotary pumps; and, peristaltic pumps. If the waste water to be pumped is not corrosive, then the pumps may be made of carbon steel, cast iron or other mild construction materials. However, if the waste water contains corrosive materials, then the construction materials must be resistant to chemicals. A table is presented which lists various construction materials and their resistance to some of the liquids commonly present as components of industrial wastes. Vertical sump pumps are ideal for use in open or closed collecting sumps, and can be controlled by float-type level controllers. Since additions for the chemical treatment of waters are usually made in terms of gal/hr, diaphragm pumps are very satisfactory. Piston pumps are used when larger capacities or higher discharge pressures are required. The pulsation of flows caused by the movement of the piston can be smoothed out by using two or three heads on the same pump. The solids content of slurries and sludges can range from 0.5% to 15% up to 75%. In general, if a slurry or sludge can be moved into the pumping elements, then it can also be moved out. Rotary pumps are the best pumps for slurry/sludge transport. They are self-priming, normally nonfouling, and provide a uniform flow. The choice of a pump for sampling has to be made individually for each particular situation. (Orr-FIRL)

CIVIL ENGINEERING FEATURES OF GEOTHERMAL POWER PLANT,
Pacific Gas and Electric Co., San Francisco, Calif.
S. Peters.
Journal of the Power Division, American Society of Civil Engineers, Vol 100, No PO2, p 157-173, December 1974. 11 fig, 2 tab, 23 ref.

Descriptors: *Geothermal studies, *Thermal powerplants, *Steam, *Thermal water, *Cooling water, *Wells, Construction costs, Thermal water, Geology, Geophysics, Heat flow, Powerplants, Thermal power, Piping systems(Mechanical), Electric power production, Engineering structures, Waste water disposal, Injection wells, Cooling towers, Seismic properties.
Identifiers: Civil engineering features, Pacific Gas and Electric Company(Cal), Site selection, Steam productivity, Geothermal plants.

A description is presented of the civil engineering features, the geology, seismicity, and the reservoir mechanism of the Geysers geothermal power project developed by the Pacific Gas and Electric Company, San Francisco, California. Site selection, construction materials, and plant design are also discussed. Steam productivity of the well is expected to decline with time, and new wells are drilled to maintain the steady supply of steam for the plant. By drilling wells at one per 40 acres, the production rate is better maintained. Geothermal plants, which do not require a supplemental source of cooling water, produce about 20 percent more condensate than is evaporated. This surplus is reinjected into unproductive wells which not only present the most efficient method of wastewater disposal, but also might prolong the life of the well field. Construction cost of geothermal capacity is about $150 per kilowatt, compared to $400 per kilowatt for fossil fuel plants and $600 per kilowatt for nuclear units. (Robinett-Arizona)

RESPONSE OF SATURATED SANDS TO CYCLIC SHEAR AT EARTHQUAKE AMPLITUDES,
Kentucky Water Resources Research Inst., Lexington.
V. P. Drnevich, and J. P. Jent.
Available from the National Technical Information Service, Springfield, Va 22161 as PB-247 551, $4.00 in paper copy, $2.25 in microfiche. Research Report No 87, October 1975. 35 p, 12 fig, 4 tab, 11 ref. OWRT A-044-KY(1). 14-31-0001-3817, 14-31-0001-4017.

Descriptors: *Earthquake engineering, *Failure, *Modulus, *Sands, Sand aquifers, Seismic design, *Seismic properties, Shear strength, Soil dynamics, Soil mechanics, *Soil properties, Soil strength, *Soil testing, Stress analysis.
Identifiers: Damping, Liquefaction, Shear modulus, Simple shear, Undrained cyclic shear.

Both quasi-static and resonant cyclic shear tests were performed on hallow cylindrical specimens of saturated sands at various densities and confining stresses. Shear moduli measured at nondestructive amplitudes were shown to be independent of frequency for the range of 0.1 Hz to 50 hz. Application of cyclic shear at larger amplitudes caused effective stresses to decrease and failure. The number of cyles to failure was related to ratio of cyclic shear stress to maximum drained shear stress. Effective confining stress reduces approximately linearly with number of cycles. Shear modulus and shear damping can be described by the Hardin-Drnevich equations if change in effective stress is properly adjusted. Procedures were developed to use research results in analyzing soil in dam or other profiles to predict factor of safety against liquifaction failure and to estimate shear modulus and damping of soils for subliquefaction conditioning when these soils are subjected to earthquakes. Identifiers: *Well design, Dykes, Indian, Hyderabad(India).

A description is presented of the problem of optimum design for dug-wells in hard rock areas, taking into account various factors relating to discharge, diameter, depth and storage capacity. The study areas in India fall into 3 distinct geological groups: (1) the granitic areas of Hyderabad, Nalgonda, Krishna, Guntur and Prakasam districts of Andhra Pradesh; (2) the sedimentary areas of Rayalaseema and adjoining parts of Telangana region; and (3) the Deccantrap area of Hyderabad district. For granitic rocks the open wells should be dug up to the bottom of the weathered zone, which is about 10 to 15 meters in Hyderabad region. Dug wells should be rectangular, with the longer side perpendicular to the strike of the shear zone or joint pattern. Since dykes act as barriers for groundwater flow, wells should be located on the upstream side of the strata. Wells located in pink granitic terrain have better chances of greater yield than do wells in the gray granite area. It is not advisable to deepen a dug-well beyond the weathered zone, but bores can be used on the side where fissures or fractures are present. (Robinett-Arizona)

Identifiers: Onondaga Lake(NY).

While the decision to provide secondary treatment of municipal and industrial waste water at the Metropolitan Syracuse Treatment Plant was made in 1965, several problems have delayed construction of the 83-mgd plant for over ten years. Preliminary studies were required, including an in-depth study of Onondaga Lake, a survey of the waste discharges of 140 industries which discharge to the sewer system, and associated investigations of joint municipal-industrial waste treatment feasibilities. The 1972 Amendments to the Water Pollution Control Act necessitated the adherence to new requirements, including infiltration/inflow studies, environmental impact and assessment statements, and public hearings. The final prob was the cost of steel product. In particular required 1,125,000 linear feet of piping. Du steel shortages and excessive prices in the sum of 1974, precast concrete piles were considere an alternative. These prestressed concrete p were eventually chosen, after the testing splice capable of taking tension. The price of struction, using the prestressed concrete p rather than those of steel, was $86.7 million, a $22 million less than the original engineering mate. (Kramer-FIRL)

AN EXPERIMENT OF FASTER GROWTH SALMON SALMO SALAR (L.) IN A SCOTTI STREAM,
Freshwater Fisheries Lab., Pitlochry (Scotland).
H. J. Egglishaw, and P. E. Shackley.
J Fish Biol. Vol 5, No 2, p 197-204. 1973.

Descriptors: *Salmon, *Trout, Fish populations

The experiment was made in an attempt to mod the usual relationship in which young trout gr faster than young salmon in streams in which t occur together. A stretch of a trout stream w stocked with advanced salmon eggs, wh produced fry earlier than the trout eggs laid na rally. The salmon grew faster than the trout were longer than the trout at the end of the gr ing season. The mean length of 77.7 mm attai by the salmon is the largest known size reached salmon in their 1st yr when feeding on natural f supplies in streams in Scotland. Survival rate fr egg planting to production of salmon of this m length was high.--Copyright 1973, Biological stracts, Inc.

TESTS OF ESTIMATES OF PREFERR SPAWNING AND REARING DISCHARGES F TROUT IN SELECTED STREAMS IN WASH TON,
Geological Survey, Tacoma, Wash.
C. H. Swift, III.
Administrative Report, 1975. 83 p, 40 fig, 3 ref.

Descriptors: *Fish management, *Spawni *Trout, *Washington, Streams, Methodolo Equations, Streamflow, Discharge(Wat Regression analysis, Evaluation.
Identifiers: *Steelhead trout(Wash).

mates of spawning and rearing discharges for lhead trout were tested in three streams in tern Washington and for six species of resident t in three streams in northeastern Washington. estimates were obtained from a set of multi- regression equations that were previously eloped on a study of 54 reaches on 18 streams estern Washington. The equations for calcu- g spawning and rearing discharges for steel- were tentatively verified for western hington streams by the finding that two-thirds ore of the determined discharges were within standard error of estimate of the discharges nated from the regression equations for nine y reaches on the Samish River, Cloquallum ek, and Middle Fork Satsop River. However, equations for steelhead are not generally ap- able for estimating spawning and rearing harges for resident trout in northeastern hington, as indicated by the finding that most he discharge determined at nine study reaches Mill Creek, Deep Creek, and Chewelah Creek e not within one standard error of estimate of harges estimated from the equations. odward-USGS)

criptors: *Trout, Nematodes, *Fish parasites. tifiers: Bulbodacnitis Ampullastoma, omis Cyanellus.

echnique was developed for differentially in- ing juvenile rainbow trout, S. gairdneri, by in- uction of the parasitic gut nematode, Bul- acnitis ampullastoma. Desired infection levels e induced in trout with 80% success. B. ampul- oma affected growth and food consumption of t in the laboratory. The effects of the parasite e evident at low and high ration levels. At low starvation ration levels the parasite effected a drawal of the energy stores of the fish. At er ration levels, the direct effects of the site were compounded by apparent parasite rference with food assimilation by the fish. B. ullastoma was directly infective to a warm- er fish, Lepomis cyanellus.--Copyright (c) , Biological Abstracts, Inc.

ENTRAPMENT OF FISHES ON INTAKE WATER SCREENS AT A STEAM ELECTRIC GENERATING STATION,
North Carolina Univ., Morehead City. Inst. of Marine Sciences.
B. Grimes.
Chesapeake Science, Vol 16, No 3, p 172-177, September 1975. 3 fig, 2 tab, 11 ref.

Descriptors: *Sampling, Fish migration, Fish, Mortalities, Temperature, Water quality, Thermal powerplants, Diurnal, Water pollution effects.
Identifiers: *Fish entrapment.

To investigate entrapment of fishes, travelling intake water screens were sampled monthly in 1969 and 1970 at a steam electric power station near Crystal River, Florida. Samples contained 73 species representing 41 families; the majority of individuals were juveniles of weak-swimming species. There was an inverse relationship between intake water temperature and catch. Highest mortalities occurred with the first cold temperatures of winter and later with lowest water temperatures. Comparison of catch-per-unit-effort during daylight and darkness in 1970 showed monthly catch-per-hour for dark sampling approximately equal to or greater than for light. Greatest disparities between day and night sampling occurred simultaneously with coldest water temperatures. (Klein)

SOIL TYPES
A Watershed Soils Index of Runoff Potential,
W76-01848 2G

SOIL WATER
Water Balance Studies,
W76-01882 3F

'ATER MOVEMENT
ote on the Moisture Diffusivity of Satu- Swelling Systems from Desorption Ex- ents,
01852 2G

t of Abrupt Textural Change on Potential es During Steady-State Infiltration,
01853 2G

d Chromatographic Analyses in Soil istry,
01636 5A

Chromatographic Analysis in Soil istry,
01638 5A

Geomorphic Relationships in a First-Order y in Central New York,
01855 2G

uring Soil Creep,
01856 7B

Associations of the Dernovich Stretch of ripyat River Floodplain, (In Belorussian),
01918 2I

INDEX
atershed Soils Index of Runoff Potential,
-01848 2G

LUCTION
suring Soil Creep,
-01856 7B

ION
ote on the Moisture Diffusivity of Satu- Swelling Systems from Desorption Ex- nents,
-01852 2G

H CAROLINA
nical and Sediment Budgets for a Small l Creek, Charleston Harbor, S. C.,
-01511 5B

vy Fall and Winter Rain in the Carolina ntains,
-01830 2B

mittee to Save Lake Murray v. Federal er Comm'n (Discharge of Treated Effluent Lake).
-01981 6E

H PLATTE RIVER (COLO)
h Platte River Flow Correlations,
-01699 4A

REIGN IMMUNITY
ntory and Quantification of Federal Water ts: A Common Denominator of Proposals Change,
-01957 6E

EANS
bean and Corn Rooting in Southwestern nesota: II. Root Distributions and Related er Inflow,
-01528 2D

NING
s of Estimates of Preferred Spawning and ring Discharges for Trout in Selected ams in Wasington,
-01575 8I

AL WATER DISTRICTS
nomics of Water Supply Planning and agement,
-01802 6B

SPECIFIC WATER INFLOW
Soybean and Corn Rooting in Southwestern Minnesota: II. Root Distributions and Related Water Inflow,
W76-01528 2D

SPECTROPHOTOMETRY
An Ultraviolet Spectrophotometric Method for the Determination of Naphthalene and Alkylnaphthalenes in the Tissues of Oil Contaminated Marine Animals,
W76-01933 5A

SPORT FISH
Inventory and Cataloging of Sport Fish and Sport Fish Waters in Southeast Alaska,
W76-01623 7C

SPRINKLER IRRIGATION
The Development of a Center Pivot Wastewater Irrigation Machine,
W76-01565 5D

Anchoring Device for a Flexible Sprinkler Hose,
W76-01724 3F

Recent Developments in Water Distribution and Application with Special Reference to Sprinkler Irrigation,
W76-01887 3F

STABILITY
Hydraulic Constants of Tidal Entrances, II: Stability of Long Island Inlets,
W76-01836 2L

STANDARDS
Appendices to: Survey Study to Select a Limited Number of Hazardous Materials to Define Amelioration Requirements,
W76-01902 5A

STANDING (LEGAL)
Inventory and Quantification of Federal Water Rights: A Common Denominator of Proposals for Change,
W76-01957 6E

STANDING WATERS
Ginn v Andrews (Action for Injunction and Damages Against Lower Adjoining Landowners for Flooding).
W76-01973 6E

STATE GOVERNMENTS
Improvement of the Quality of Water Supply Sources (Policy Statement of American Water Works Association).
W76-01962 6E

STATE JURISDICTION
Facilities Plans: Clearing Up the Confusion,
W76-01782 5G

Inventory and Quantification of Federal Water Rights: A Common Denominator of Proposals for Change,
W76-01957 6E

Warner v. Replinger ('Bay' Definition).
W76-01994 6E

STATISTICAL METHODS
A Review of Statistical Procedures used for Examination of Water Data,
W76-01509 7A

STEAM
Production of Superheated Steam from Vapor-Dominated Geothermal Reservoirs,
W76-01587 3E

Civil Engineering Features of Geothermal Power Plant,
W76-01701 8C

STEEL
A Survey of Wastewater Treatment Techniques for Steel Mill Effluents,
W76-01631 5D

The Treatment of Blast Furnace Gas Washing Effluent,
W76-01633 5D

Limestone Treatment of Rinse Waters from Hydrochloric Acid Pickling of Steel,
W76-01641 5D

STEEL PICKLING WATER
Limestone Treatment of Rinse Waters from Hydrochloric Acid Pickling of Steel,
W76-01641 5D

STEELHEAD TROUT (WASH)
Tests of Estimates of Preferred Spawning and Rearing Discharges for Trout in Selected Streams in Wasington,
W76-01575 8I

STOCHASTIC PROCESSES
A Scheme for Stochastic State Variable Water Resources Systems Optimization,
W76-01685 2E

Stochastic Models for Ground Water Levels,
W76-01799 4B

STORAGE CAPACITY
Effect of Valley Shape on Retention Basin Performance,
W76-01773 4A

STORM RUNOFF
Estimation of Urban Stormwater Quality in Kalihi Stream Drainage Basin, Oahu, Hawaii,
W76-01525 5B

Mathematical Model for Establishing the Overflow Spillway Discharges in the Flood Storage Ponds,
W76-01762 4A

Storm Runoff in the Vicinity of Oak Ridge, Tennessee,
W76-01841 2A

Multi-Purpose Combined Sewer Overflow Treatment Facility, Mount Clemens, Michigan,
W76-01874 5D

STORMWATER QUALITY
Estimation of Urban Stormwater Quality in Kalihi Stream Drainage Basin, Oahu, Hawaii,
W76-01525 5B

STRAITS
International Straits: The Right of Access,
W76-01965 6E

STRATIGRAPHY
Stratigraphy of Atlantic Coastal Margin of United States North of Cape Hatteras--Brief Survey,
W76-01583 2L

STREAMFLOW
Relationships of Low, Average and Flood Flows for Streams in the Pacific Northwest,
W76-01507 2E

General Model to Simulate Flow in Branched Estuaries,
W76-01580 2L

STREAMFLOW

Map Showing Flood of April 1975 at Meridian Township, Michigan,
W76-01584 7C

History of Irrigation and Characteristics of Streamflow in Northern Nebraska,
W76-01589 4A

Long-Term Streamflow Records Reconstructed from Tree Rings,
W76-01708 2B

Regional Instream Flow Needs in the Pacific Northwest: An Analysis of Institutional, Legal, and Technological Aspects of Allocation Processes for Limited Streamflow,
W76-01797 6B

Relationship of Discharge Reductions to Available Trout Habitat for Recommending Suitable Streamflows,
W76-01809 4A

Storm Runoff in the Vicinity of Oak Ridge, Tennessee,
W76-01841 2A

STREAMS

Relationships Between Selected Physical Parameters and Benthic Community Structure in a Small Mountain Stream,
W76-01803 2I

STREPTOCOCCUS

Pathogenicity Studies with a Streptococcus SP. Isolated from Fishes in an Alabama-Florida Fish Kill,
W76-01922 5C

STRIP MINING

Water Quality Control in Mine Spoils, Upper Colorado River Basin,
W76-01870 5G

STRUCTURAL MODELS

Evaluating the Impact of Structurally Interrupted Flood Plain Flows,
W76-01808 4A

SUBLETHAL EFFECTS

Translocation of Hydrocarbons in Aquatic Food Chains,
W76-01921 5C

SUBMERGED JETS

Turbulent Jets with Reversible Buoyancy,
W76-01849 5B

SUBMERGED PLANTS

Above Ground Production and Chemical Analysis of Phragmites Communis in Polluted Brackish Water,
W76-01943 5C

SUBSOIL

The Common Hertiage of Mankind as a Legal Concept,
W76-01952 6E

SUBSURFACE DRAINAGE

Use of Drainage Wells,
W76-01566 4B

Bi-Level Subsurface Drainage Theory,
W76-01847 2F

SUBSURFACE DRAINS

Low Pressure Jet Cleaning of Plastic Drains in Sandy Soil,
W76-01569 8B

SUBSURFACE IRRIGATION

Recent Developments in Water Distribution and Application with Special Reference to Sprinkler Irrigation,
W76-01887 3F

SUCTION SAMPLER

A Suction Sampler for Quantitatively Sampling Benthos on Rocky Substrates in Rivers,
W76-01905 7B

SUDAN

Dispersion as an Index of Relative Hydraulic Conductivity in Salt-Affected Soils of the Sudan,
W76-01694 2G

SUGAR BEETS

Conserving Our Resources--The Contribution of Chemical Technology,
W76-01630 3E

SULFIDE CONTROL

Controlling Sulfides in Sanitary Sewers Using Air and Oxygen,
W76-01877 5G

SULFUR BACTERIA

Participation of Microorganisms in Sulfur Turnover in Pomiaretzkoe Lake, (In Russian),
W76-01774 5C

SUMMER LAKE (OREG)

Solute Balance at Abert and Summer Lakes, South-Central Oregon,
W76-01570 2H

SUNFISHES

Chronic Effects of Copper on Survival, Growth, and Reproduction of the Bluegill (Lepomis Macrochirus),
W76-01906 5C

SURBER SAMPLER

A Comparison of Four Samplers for Benthic Macroinvertebrates Inhabiting Coarse River Deposits,
W76-01909 7B

SURFACE ALBEDO

Surface Albedo and Desertification,
W76-01705 2B

SURFACE DRAINAGE

Falco v. James Peter Associates, Inc. (Action by Contiguous Landowners for Damages and Injunctive Relief Arising Out of Alleged Change of Natural Flow of Surface Water).
W76-01989 6E

Ullian v. Cullen (Appeal from Decision Restraining Obstruction of a Watercourse Carrying Flow of Surface Water from Adjoining Property).
W76-01991 6E

SURFACE-GROUNDWATER RELATIONSHIPS

South Platte River Flow Correlations,
W76-01699 4A

Integrating Ground and Surface Water Use in an Appropriation State,
W76-01960 4B

SURFACE IRRIGATION

Design of Irrigation Runoff Recovery Systems,
W76-01702 3F

Surface Irrigation Methods and Practices,
W76-01885 3F

Investigations on Surface Irrigation Methods in the Euphrates Basin,
W76-01888 3F

SURFACE RUNOFF

Ullian v. Cullen (Appeal from Decision Restraining Obstruction of a Watercourse Carrying Flow of Surface Water from Adjoining Property)
W76-01991 6E

SURFACE WATER

Quality of Surface Waters of the United States, 1969: Part 3. Ohio River Basin
W76-01577 2K

SURFACE WATERS

Canal Evaporation Determined by Thermal Modeling,
W76-01582 2D

History of Irrigation and Characteristics of Streamflow in Northern Nebraska,
W76-01589 4A

Commonwealth, Department of Highways v. Jent (No Loss of Reasonable Access to Highway Because of Change in Surface Water Drainage).
W76-01999 6E

SURGES

Device for Damping the Surge of Water Waves Particularly for a Floating Body Designed to Clean Polluted Water,
W76-01731 5G

SURVEYS

Dallas Rate Survey.
W76-01601 6C

Sanitary Surveys and Survival Curves of Septic Tank Systems,
W76-01744 5D

SUSPENDED SOLIDS

The Short Term Variation in Suspended Sediment Concentration Caused by the Passage of a Boat Wave Over a Tidal Flat Environment,
W76-01827 2L

SWELLING SOILS

A Note on the Moisture Diffusivity of Saturated Swelling Systems from Desorption Experiments,
W76-01852 2G

SWIMMING

Capacity of Water-Based Recreation Systems, Part III: Methodology and Findings,
W76-01804 6B

SYNEDRA ULNA

Status of Uptake of Mercury by the Fresh Water Diatom, Synedra Ulna,
W76-01913 5C

SYSTEMATICS

An Information Retrieval System for the Macroinvertebrate Fauna of Indiana Rivers and Lakes,
W76-01513 2I

A Study of Lagoonal and Estuarine Processes in the Area of Merritt Island Encompassing the Space Center--Annual Report, 1 Jul. 1973--31 Aug. 1974.
W76-01893 2L

IS ANALYSIS
lected Annotated Bibliography on the sis of Water Resource Systems, Sixth e.
1517 6A

eme for Stochastic State Variable Water rces Systems Optimization,
1685 2E

RY WASTES
Quality Aspects of Tannery Effluents sal,
1645 5D

opment Document for Effluent Limita- Guidelines and New Source Performance ards for the Leather Tanning and Finish- int Source Category,
1816 5D

GRADES
e Meiofauna of a New York City Beach Particular Reference to Tardigrada,
1930 5C

ated Carbon Fights Bad Taste,
1553 5F

A LONGICORNIS
es on the Effects of Temperature on Egg g of Three Species of Calanoid Copepods Laboratory (Acartia Tonsa, Temora Lon- is, Pseudocalanus Elongatus),
1927 5C

RATURE
ard Conductivity Cell for Measurement of Water Salinity and Temperatures,
1716 2K

ts of Quality and Quantity of Food on n Shiner, Notemigonus Crysoleucas, uction,
1900 2I

tance of a Northwestern Crayfish, astacus Leniusculus (Dana) to Elevated eratures,
1907 5C

es on the Effects of Temperature on Egg g of Three Species of Calanoid Copepods Laboratory (Acartia Tonsa, Temora Lon- is, Pseudocalanus Elongatus),
1927 5C

SSEE
n Runoff in the Vicinity of Oak Ridge, essee,
1841 2A

CING
omics of Land Leveling for Dryland Grain uction,
1692 3F

TORIAL SEA
ne Pollution-Prevention-Wastes, Etc.
1992 6E

TORIAL WATERS
Fisheries Jurisdiction Cases: The Contribu- of the International Court of Justice to the te on Coastal States' Fisheries Rights,
1954 6E

ARY TREATMENT
ary Treatment of Process Water,
1634 5D

Biological Regeneration of Activated Carbon in Advanced Wastewater Treatment,
W76-01684 5D

Technology and $20 Billion Advance Wastewater Effort.
W76-01749 5D

TEST WELLS
Use of Test Wells as Water-Quality Predictions,
W76-01768 5A

TETON (DAM)
Hydraulic Model Studies of the Teton Canal Outlet Works Energy Dissipator,
W76-01833 8B

TEXTILE DYE REMOVAL
Treating Dye Wastewater,
W76-01629 5D

TEXTILES
Water Conservation--An Alternative to Solvent Dyeing,
W76-01628 3E

Treating Dye Wastewater,
W76-01629 5D

Some Problems of Textile Mill-Generated Wastewater Treatment in the Lodz Urban Agglomeration (Niektore Problemy Oczyszczania Sciekow Przemyslu Wlokienniczego na Terenie Lodzkiej Aglomeracji Miejskiej),
W76-01673 5D

Biofiltration System for Fabric Producer.
W76-01674 5D

Hydrocyclone for Clarifying Wool-Washing Liquid,
W76-01675 5D

The Treatment of Textile Dyehouse Effluent.
W76-01676 5D

Treatment of Wool Scouring Wastes,
W76-01728 5D

THAMES WATER AUTHORITY
An Innovative Organizational Arrangement for Comprehensive Water Services: The Thames Water Authority as a Model for Complex Areas of the Great Lakes,
W76-01815 6E

THERMAL POLLUTION
Three-Dimensional Simulation of Thermally-Influenced Hydrodynamic Flows,
W76-01518 5B

Studies on the Tolerance of Young of the Year Mississippi River Fish to Heated Waters,
W76-01520 5C

Feasibility of Remote Sensing for Detecting Thermal Pollution--Part I: Feasibility Study; Part II: Implementation plan,
W76-01838 5A

Remote Sensing Applications in Marine Science Programs at Vims,
W76-01839 7B

The Distribution of Excess Temperature from the Vienna Generating Station on the Nanticoke River,
W76-01843 5B

Turbulent Jets with Reversible Buoyancy,
W76-01849 5B

Comparative Discharges of Fresh and Waste Water Along the California Coast,
W76-01914 5B

A Respirometer Technique for Evaluating the Potential Effects of Rapid Thermal Changes to Small Aquatic Organisms,
W76-01920 5C

Studies on the Effects of Temperature on Egg Laying of Three Species of Calanoid Copepods in the Laboratory (Acartia Tonsa, Temora Longicornis, Pseudocalanus Elongatus),
W76-01927 5C

THERMAL POWERPLANTS
Civil Engineering Features of Geothermal Power Plant,
W76-01701 8C

THERMAL RADIATION
Determination of Points of Entry for Potential Contaminants into Limestone Aquifers Using Thermal Infrared Imagery,
W76-01840 5B

THERMAL SPRINGS
Chemical Analysis of Trace Elements in Iceland Geysirs with Remarks on Mastigocladus Laminosus Cohn,
W76-01912 5A

THERMAL STRATIFICATION
The Long-Period Internal Waves in Lake Biwa,
W76-01845 2H

THERMAL STRESS
Studies on the Tolerance of Young of the Year Mississippi River Fish to Heated Waters,
W76-01520 5C

THERMAL WATER
Production of Superheated Steam from Vapor-Dominated Geothermal Reservoirs,
W76-01587 3E

Evaluation of Geothermal Activity in the Truckee Meadows, Washoe County, Nevada,
W76-01683 5B

Civil Engineering Features of Geothermal Power Plant,
W76-01701 8C

TIDAL EFFECTS
Hydraulic Constants of Tidal Entrances, II: Stability of Long Island Inlets,
W76-01836 2L

TIDAL INLETS
Hydraulic Constants of Tidal Entrances, II: Stability of Long Island Inlets,
W76-01836 2L

TIDAL MARSHES
Chemical and Sediment Budgets for a Small Tidal Creek, Charleston Harbor, S. C.,
W76-01511 5B

The Short Term Variation in Suspended Sediment Concentration Caused by the Passage of a Boat Wave Over a Tidal Flat Environment,
W76-01827 2L

TIDAL STREAMS
General Model to Simulate Flow in Branched Estuaries,
W76-01580 2L

The Distribution of Excess Temperature from the Vienna Generating Station on the Nanticoke River,
W76-01843 5B

TILAPIA
Effects of Agricultural Limestone on Water Chemistry, Phytoplankton Productivity, and Fish Production in Soft Water Ponds,
W76-01936 5C

TIME SERIES ANALYSIS
A Review of Statistical Procedures used for Examination of Water Data,
W76-01509 7A

Long-Term Streamflow Records Reconstructed from Tree Rings,
W76-01708 2B

Extraction of Information on Inorganic Water Quality,
W76-01844 5A

TISSUE ANALYSIS
Factors Affecting the Accumulation and Removal of Mercury from Tissues of the American Oyster Crassostrea Virginica,
W76-01924 5C

TOLUENE
Stimulation and Inhibition of Phytoplankton Growth by Low Molecular Weight Hydrocarbons,
W76-01923 5C

TOPOGRAPHY
Estimating Evapotranspiration Under Non-homogeneous Field Conditions,
W76-01707 2D

TOXICITY
Chronic Effects of Copper on Survival, Growth, and Reproduction of the Bluegill (Lepomis Macrochirus),
W76-01906 5C

Translocation of Hydrocarbons in Aquatic Food Chains,
W76-01921 5C

Total Mercury in Some Fish and Shellfish Along the Mexican Coast,
W76-01925 5C

TOXICOLOGY
Some New Approaches to Solving Urgent Problems in the Theory and Practice of Hygienic Standards for Injurious Substances ,
W76-01659 5G

TRACE ELEMENTS
Sources and Distribution of Trace Metals in Aquatic Environments,
W76-01651 5B

Chemical Analysis of Trace Elements in Iceland Geysirs with Remarks on Mastigocladus Laminosus Cohn,
W76-01912 5A

TRACE METALS SOURCES
Sources and Distribution of Trace Metals in Aquatic Environments,
W76-01651 5B

TRACERS
Tracer Experiments on the Effect of Micronutrients on the Growth of Porphyra Plants-II Manganese-54 and Zinc-65 Assimilation in Relation to Environmental Factors,
W76-01916 5C

TRAINING
A Curriculum Activaties Guide to Water Pollution and Environmental Studies, Appendices, Volume 2.
W76-01660 5G

Training and Extension for Effective use of Irrigation Water,
W76-01890 3F

The Safe Drinking Water Act and EPA's Role in Training,
W76-01963 5G

TRANSITION METALS
Chemical Analysis of Trace Elements in Iceland Geysirs with Remarks on Mastigocladus Laminosus Cohn.
W76-01912 5A

TRANSPORTATION
Planning for Coastal Recreation Opportunities Near Large Urban Areas: A Study Relating Transportation and Recreation,
W76-01516 6B

Operational Systems for Snow Removal and Ice Control: A Background/Resource Paper for the Upper Great Lakes University Consortium for Transportation Research,
W76-01591 4A

The Effects of Ferry Traffic on Rocky Shore Vegetation in the Southern Aland Archipelago,
W76-01949 5C

Marine Pollution-Prevention-Wastes, Etc.
W76-01992 6E

TREATIES
Choctaw Nation v Cherokee Nation (Dispute over Title to Bed of Arkanas River).
W76-01979 6E

TREATMENT
State of the Art--Acid Mine Drainage Control,
W76-01625 5G

TREATMENT FACILITIES
Chicago's System of Sludge Transport to Land Reclamation Sites.
W76-01544 5E

Miami Pushes Regionalization to Keep Pace with Population,
W76-01546 5D

Upgrading Highway Service Area Wastewater Treatment Plants,
W76-01559 5D

Precast Concrete Piles Cut Plant Construction Cost.
W76-01560 8F

Waste Treatment for the Pabst Brewery at Perry, Georgia,
W76-01640 5D

UNOX System Pilot Plants-Two Years' Experience with Pure Oxygen in the Activated Sludge Process,
W76-01740 5D

Secondary Treatment at Long Reach,
W76-01741 5D

Greater Vancouver Opens Annacis Treatment Plant,
W76-01746 5D

Rehabilitation of a Recreational Lake Through Areawide Sewerage.
W76-01750 5D

EPA Completes New Plant and Sewer Index Data Series.
W76-01785 5G

Government Dollars to Fuel 18% Growth 1976 Sewerage Market
W76-01794

Alarm Systems Provide Low Cost Environmental Protection,
W76-01795

TREATMENT LEVELS
A Bargaining Approach for Programm Least-Cost Waste Treatment Along a River,
W76-01504

TRICKLE IRRIGATION
Trickle Irrigation Lateral Design,
W76-01568

TROUT
An Experiment of Faster Growth of Salm Salmo Salar (L.) in a Scottish Stream.
W76-01537

Tests of Estimates of Preferred Spawning Rearing Discharges for Trout in Selec Streams in Wasington,
W76-01575

Effects of a Parasitic Gut Nematode on C sumption and Growth in Juvenile Rainb Trout (Salmo Gairdneri),
W76-01622

Relationship of Discharge Reductions Available Trout Habitat for Recommend Suitable Streamflows,
W76-01809

TROUT COVER
Relationship of Discharge Reductions Available Trout Habitat for Recommend Suitable Streamflows,
W76-01809

TRUCKEE MEADOWS (NEV)
Uniqueness of a Model of Steady-S Ground-Water Flow,
W76-01526

Evaluation of Geothermal Activity in Truckee Meadows, Washoe County, Nevada
W76-01683

TURBIDITY CURRENTS
The Migration of Fly Larvae (Simuliidae) Water With High Levels of Turbidity(in R sian).
W76-01615

TURBULENT FLOW
Turbulent Jets with Reversible Buoyancy,
W76-01849

TURNOVERS
Participation of Microorganisms in Sulfur T nover in Pomiaretzkoe Lake, (In Russian),
W76-01774

U.N. CONFERENCE ON THE LAW OF THE SEA
The Fisheries Jurisdiction Cases: The Contri tion of the International Court of Justice to Debate on Coastal States' Fisheries Rights,
W76-01954

CENTERS OF COMPETENCE AND THEIR SUBJECT COVERAGE

- Ground and surface water hydrology at the Illinois State Water Survey and the Water Resources Division of the U.S. Geological Survey, U.S. Department of the Interior.
- Metropolitan water resources planning and management at the Center for Urban and Regional Studies of University of North Carolina.
- Eastern United States water law at the College of Law of the University of Florida.
- Policy models of water resources systems at the Department of Water Resources Engineering of Cornell University.
- Water resources economics at the Water Resources Center of the University of Wisconsin.
- Eutrophication at the Water Resources Center of the University of Wisconsin.
- Water resources of arid lands at the Office of Arid Lands Studies of the University of Arizona.
- Water well construction technology at the National Water Well Association.
- Water-related aspects of nuclear radiation and safety at the Oak Ridge National Laboratory.
- Water resource aspects of the pulp and paper industry at the Institute of Paper Chemistry.

Supported by the Environmental Protection Agency in cooperation with WRSIC

- Effect on water quality of irrigation return flows at the Department of Agricultural Engineering of Colorado State University.
- Agricultural livestock waste at East Central State College, Oklahoma.
- Municipal wastewater treatment technology at the Franklin Institute Research Laboratories.

Subject Fields

1 NATURE OF WATER

LIBRARY U. OF I. URBANA-CHAMPAIGN

SELECTED WATER RESOURCES ABSTRACTS is produced by the Office of Water Research and Technology, U.S. Department of the Interior, and published twice monthly by the National Technical Information Service (NTIS), U.S. Department of Commerce, for the Water Resources Scientific Information Center (WRSIC).

SELECTED WATER RESOURCES ABSTRACTS (SWRA) is available to Federal agencies and their contractors or grantees in water resources research upon request, citing contract or grant number and sponsoring agency. Write: Manager, Water Resources Scientific Information Center, Office of Water Research and Technology, U.S. Department of the Interior, Washington, DC 20240.

SELECTED WATER RESOURCES ABSTRACTS is also available on subscription from NTIS, 5285 Port Royal Road, Springfield, VA 22161. Annual subscription rates are: SWRA Journal only, $75 ($95 foreign); Journal and Annual Indexes, $100 ($125 foreign); Indexes only, $50 ($65 foreign).

Some documents abstracted in this journal can be purchased from NTIS at prices shown in the entry; prices subject to change. Other documents are available from originating organizations or authors as indicated in the citation.

SELECTED WATER RESOURCES ABSTRACTS

A Semimonthly Publication of the Water Resources Scientific Information Center, Office of Water Research and Technology, U.S. Department of the Interior

VOLUME 9, NUMBER 5
MARCH 1, 1976

W76-02001 -- W76-02500

ry of the U.S. Department of the Interior has de-
t the publication of this periodical is necessary in the
f the public business required by law of this Depart-
ment. Use of funds for printing this periodical has been approved by the Director of the Office of Management and Budget through August 31, 1978.

As the Nation's principal conservation agency, the Department of the Interior has responsibility for most of our nationally owned public lands and natural resources. This includes fostering the wisest use of our land and water resources, protecting our fish and wildlife, preserving the environmental and cultural values of our national parks and historical places, and providing for the enjoyment of life through outdoor recreation. The Department assesses our energy and mineral resources and works to assure that their development is in the best interests of all our people. The Department also has a major responsibility for American Indian reservation communities and for people who live in Island Territories under U.S. administration.

LIBRARY U. OF I. URBANA-CHAMPAIGN

FOREWORD

ected Water Resources Abstracts, a semimonthly urnal, includes abstracts of current and earlier pertinent graphs, journal articles, reports, and other publication s. The contents of these documents cover the water- d aspects of the life, physical, and social sciences as s related engineering and legal aspects of the charac- cs, conservation, control, use, or management of water. abstract includes a full bibliographical citation and a set criptors or identifiers which are listed in the **Water urces Thesaurus.** Each abstract entry is classified into ds and 60 groups similar to the water resources re- n categories established by the Committee on Water urces Research of the Federal Council for Science and ology.

C IS NOT PRESENTLY IN A POSITION TO PROVIDE ES OF DOCUMENTS ABSTRACTED IN THIS JOUR- Sufficient bibliographic information is given to enable rs to order the desired documents from local libraries er sources.

ted Water Resources Abstracts is designed to serve ientific and technical information needs of scientists, eers, and managers as one of several planned services Water Resources Scientific Information Center IC). The Center was established by the Secretary of the r and has been designated by the Federal Council for ce and Technology to serve the water resources com- y by improving the communication of water-related rch results. The Center is pursuing this objective by co- ting and supplementing the existing scientific and tech- nformation activities associated with active research vestigation program in water resources.

ovide WRSIC with input, selected organizations with water resources research programs are supported as ers of competence" responsible for selecting, abstract- ing, and indexing from the current and earlier pertinent literature in specified subject areas.

Additional "centers of competence" have been established in cooperation with the Environmental Protection Agency. A directory of the Centers appears on the inside back cover.

Supplementary documentation is being secured from established discipline-oriented abstracting and indexing services. Currently an arrangement is in effect whereby the Bio-Science Information Service of Biological Abstracts supplies WRSIC with relevant references from the several subject areas of interest to our users. In addition to Biological Abstracts, references are acquired from Bioresearch Index which are without abstracts and therefore also appear abstractless in SWRA. Similar arrangements with other producers of abstracts are contemplated as planned augmentation of the information base.

The input from these Centers, and from the 51 Water Resources Research Institutes administered under the Water Resources Research Act of 1964, as well as input from the grantees and contractors of the Office of Water Research and Technology and other Federal water resource agencies with which the Center has agreements becomes the information base from which this journal is, and other information services will be, derived; these services include bibliographies, specialized indexes, literature searches, and state-of-the-art reviews.

Comments and suggestions concerning the contents and arrangements of this bulletin are welcome.

FOREWORD III

SUBJECT FIELDS AND GROUPS

Please use the edge index on the back cover to locate Subject Fields and Indexes

01 NATURE OF WATER
Includes the following Groups: Properties; Aqueous Solutions and Suspensions

02 WATER CYCLE
Includes the following Groups: General; Precipitation; Snow, Ice, and Frost; Evaporation and Transpiration; Streamflow and Runoff; Groundwater; Water in Soils; Lakes; Water in Plants; Erosion and Sedimentation; Chemical Processes; Estuaries.

03 WATER SUPPLY AUGMENTATION AND CONSERVATION
Includes the following Groups: Saline Water Conversion; Water Yield Improvement; Use of Water of Impaired Quality; Conservation in Domestic and Municipal Use; Conservation in Industry; Conservation in Agriculture

04 WATER QUANTITY MANAGEMENT AND CONTROL
Includes the following Groups: Control of Water on the Surface; Groundwater Management; Effects on Water of Man's Nonwater Activities; Watershed Protection

05 WATER QUALITY MANAGEMENT AND PROTECTION
Includes the following Groups: Identification of Pollutants; Sources of Pollution; Effects of Pollution; Waste Treatment Processes; Ultimate Disposal of Wastes; Water Treatment and Quality Alteration; Water Quality Control.

06 WATER RESOURCES PLANNING
Includes the following Groups: Techniques of Planning; Evaluation Process; Cost Allocation, Cost Sharing, Pricing/Repayment; Water Demand; Water Law and Institutions; Nonstructural Alternatives; Ecologic Impact of Water Development.

07 RESOURCES DATA
Includes the following Groups: Network Design; Data Acquisition; Evaluation, Processing and Publication.

08 ENGINEERING WORKS
Includes the following Groups: Structures; Hydraulics; Hydraulic Machinery; Soil Mechanics; Rock Mechanics and Geology; Concrete; Materials; Rapid Excavation; Fisheries Engineering.

09 MANPOWER, GRANTS, AND FACILITIES
Includes the following Groups: Education—Extramural; Education—In-House; Research Facilities; Grants, Contracts, and Research Act Allotments.

10 SCIENTIFIC AND TECHNICAL INFORMATION
Includes the following Groups: Acquisition and Processing; Reference and Retrieval; Secondary Publication and Distribution; Specialized Information Center Services; Translations; Preparation of Reviews.

R. C. Palmquist.
Geological Society of America Bulletin, Vol 86, No 10, p 1392-1398, October 1975. 7 fig, 4 tab, 21 ref.

Descriptors: *Streams, *Alluvium, *Bedrock, *Cross-sections, *Sediments, *Valleys, Subsurface mapping, Meanders, Erosion, Frequency analysis, Scour, Model studies.
Identifiers: *Bedrock valleys, *Preferred position model, Underfit streams, Stream geometry, Symmetry indices.

In the preferred position model, the most common location of a stream within its valley is related to the transverse profile of the bedrock surface below the alluvium. The model postulates that if a stream scours bedrock at least occasionally, the amount of bedrock erosion will be proportioned to the duration of occupation by the stream of any particular portion of the valley floor. The transverse subsurface profile of the bedrock floor of the valley will be asymmetric if the stream tends to remain against one valley wall. Data on distribution of streams in their valleys indicate that streams preferentially occupy the outer half of their valleys at a bend but have no preferred position within straight reaches. The symmetry variations in the transverse profiles of bedrock valleys reflect these position variations. Borehole data suggest that, on the average, maximum scour depth occurs to a depth twice the bank height. Some streams that flow on alluvium and appear underfit may, in fact, be fit and some aspects of the underfit stream model are in need of re-evaluation. (Singh-ISWS)

RAINFALL-RUNOFF AS SPATIAL STOCHASTIC PROCESSES: DATA COLLECTION AND SYNTHESIS,
Massachusetts Inst. of Tech., Cambridge. Ralph M. Parsons Lab. for Water Resources and Hydrodynamics.
R. L. Bras, and I. Rodriguez-Iturbe.
Report No 196; January 1975. 382 p, 37 fig, tab, ref. OWRT C-4118(9021). No 4-36738.

Descriptors: *Rainfall-Runoff relationships, *Rainfall, *Precipitation(Atmospheric), *Runoff, *Rain, *Climatology, *Stochastic processes, *Storm runoff, Storms, Forecasting, Flow, Weather forecasting, Flood forecasting, Rainfall intensity, Subsurface runoff.
Identifiers: *Rainfall-runoff models, Rainfall generators, Storm interior, Kinematic waves, Kinematics, Surface water runoff, Rainfall predictions, Runoff predictions.

This work recognize rainfall and runoff as multidimensional stochastic processes. Using the knowledge of such processes, a procedure for designing an optimal network to measure the total precipitation of an event over a fixed area is given. The methodology used in this static problem allows consideration of the following aspects of network design: (1) spatial correlation of process, (2) errors of measurement techniques and their correlation, and (3) non-homogeneous sampling costs. Optimal networks are given in terms of the number and location of stations together with the resulting costs and mean square error of estimation. The relation between rainfall and runoff is recognized as a dynamic problem. A statistically non-stationary, multi-dimensional rainfall generator is suggested. The model, capable of simulating historical storm exteriors, assumes the validity of Taylor's hypothesis of turbulence within a storm interior. The suggested rainfall model is used together with a runoff model to study the accuracy of discharge prediction as a function of the rainfall sampling network. The runoff model used is a spatially distributed simulation based on a finite difference solution of the Kinematic wave equations. (NOAA)

A STOCHASTIC ELECTRICAL MODEL OF AN INFINITE CLOUD: CHARGE GENERATION AND PRECIPITATION DEVELOPMENT,
Tel-Aviv Univ. (Israel). Dept. of Environmental Sciences.
W. D. Scott, and Z. Levin.
Journal of the Atmospheric Sciences, Vol 32, No 9, p 1814-1828, September 1975, 11 fig, 1 tab, 32 ref. AERO DA-ERO-124-74-G0058.

Descriptors: *Model studies, *Cloud physics, *Electric fields, *Precipitation(Atmospheric), Mathematical models, Stochastic processes, Clouds, Thunderstorms, Rainfall, Coalescences, Computer models, Drops(Fluids), Electrical studies, Electrical properties, Meteorology.
Identifiers: *Electrical charge generation.

A stochastic numerical cloud model was used to investigate simultaneously the growth of precipitation, the formation of electrical charges on the particles, and the development of the ambient electric field utilizing the polarization charging mechanism. The results indicated a close coupling between precipitation growth and electrification. Precipitation was reduced when the electric field reached magnitudes of kilovolts per centimeter. The distributions of charge on the particles showed charges of a realistic magnitude. It was concluded that the electrical repulsion of particles with charges of like sign directly decreases rain formation but indirectly results in additional partial coalescence events, a greater field growth, and early particle suspension. The electrical attraction of particles with charges of opposite sign can cause greatly enhanced precipitation formation

GENERATION OF HOURLY RAINFALL,
Nigeria Univ., Nsukka. Dept. of Civil Engineering.
N. Egbuniwe.
Water Resources Bulletin, Vol 11, No 4, p 706-713, August 1975, 3 fig, 2 tab, 8 ref.

Descriptors: *Simulated rainfall, *Stochastic processes, Rainfall, Model studies, Linear programming, Storms, Storm runoff, Flow duration, Historic floods, Rainfall-runoff relationships, Hydrology, Synthetic hydrology.
Identifiers: *Hourly rainfall, *Rainfall model, *Nigeria, Stanford Watershed Model, Linear regression, Storm duration, Historical rainfall.

A rainfall model was developed to divide daily rainfall into storms and distribute storm depths over storm duration for input into the Stanford Watershed Model. Rainfall data were collected in Nigeria by the Nigerian Meteorological Services. Most of the stations were located at airports where weather observations were considered more important than watershed studies. However, there were many stations where daily rainfall was measured, and a few that recorded hourly amounts. The study developed a rainfall model that could generate from daily totals for input into the Stanford Model. Five years of historical hourly rainfall data were processed for Yelwa, Nigeria. The model was found to be adequate when the output from the watershed model did not differ substantially from historical rainfall data. (Roberts-ISWS)

APPROXIMATION FORMULAS FOR THE EQUILIBRIUM SIZE OF AN AERSOL PARTICLE AS A FUNCTION OF ITS DRY SIZE AND COMPOSITION AND THE AMBIENT RELATIVE HUMIDITY,
Naval Research Lab., Washington, D.C.
J. W. Fitzgerald.
Journal of Applied Meteorology, Vol 14, No 6, p 1044-1049, September 1975. 5 fig, 1 tab, 13 ref.

Descriptors: *Nucleation, *Aerosols, *Humidity, Cloud seeding, Condensation, Particle size, Absorption, Adsorption, Equations, Mathematical models, Chemistry, Drops(Fluids), Atmosphere, Electrolytes, Clouds, Precipitation(Atmospheric), Meteorology.

Approximations to the exact equations describing the variation with relative humidity of the equilibrium size of aqueous solution droplets were developed. For relative humidities between 81 and 99.5%, and for droplets formed by particles composed of greater than 60% by mass of any one of nine common electrolytes and having a dry radius in the range of 0.05 to 3.0 micrometer, the approximation formulas presented were accurate to within 5%. Using these formulas, an expression was obtained for the size distribution of a chemically homogeneous aerosol as a function of relative humidity. (Sims-ISWS)
W76-02421

SELECTED CASES OF CONVECTIVE PRECIPITATION CAUSED BY THE METEROPOLITAN AREA OF WASHINGTON, D.C.,
Maryland Univ., College Park. Dept. of Meteorology.
R. P. Harnack, and H. E. Landsberg.
Journal of Applied Meteorology, Vol 14, No 6, p 1050-1060, September 1975. 12 fig, 2 tab, 19 ref.

Descriptors: *Precipitation(Atmospheric), *Rainfall disposition, *Cities, Rainfall, Convection, Heating, Temperature, Atmoshpere, Cloud physics, Rain, On-site investigations, Model studies, Meteorology, *District of Columbia.
Identifiers: *Washington(D.C.), Urban effects, Case studies.

The release of isolated summer showers in the Washington, D.C., area, as related to the urban heat island, was studied for nine propitious synoptic situations in 1968, 1972, and 1973. Parcel theory, using urban surface temperature and upper air soundings, permitted comparison between predicted and observed cloud behavior. In all cases the urban thermal effect seemed to be the likely trigger force for shower development. Vertical wind data and cloud energetics permitted an estimate of rainfall positioning in the metropolitan area. In eight of the nine cases, this yielded the correct placing of the urban-induced showers. The study further documented this type of inadvertent rainfall augmentation. Three cases were presented. (Sims-ISWS)

OPTIMIZING RAINFALL ESTIMATES WITH THE AID OF RADAR,
National Severe Storms Lab., Norman, Okla.
E. A. Brandes.
Journal of Applied Meteorology, Vol 14, No 7, p 1339-1345, October 1975, 8 fig, 5 tab, 18 ref.

Descriptors: *Rainfall, *Radar, *Rain gages, *Oklahoma, Measurement, Gaging, Networks, Analytical techniques, Data processing, Estimating, Precipitation(Atmospheric), Precipitation gages, Remote sensing, Weather patterns, Rainfall disposition, Meteorology.
Identifiers: *Radar rainfall measurements, Errors.

Estimates of precipitation are improved when raingage observations are used to calibrate quantitative radar data as well as to estimate precipitation in areas without radar data. Estimated areal precipitation depth errors for nine rainfalls over a 3000 sq km watershed averaged 13 and 14% (1.5 and 1.8 mm) when the radar was calibrated by networks of raingages having densities of one gage per 900 and 1600 sq km. Areal precipitation estimates derived from rainfalls observed at the gages alone produced errors of 21 and 24% (2.5 and 3.0 mm). Adjusting the radar data by a single calibration factor (the simple average ratio of gage-observed and radar-inferred rainfall at all input gages without regard to the spatial variation among ratios) resulted in error reduction to 18% (2.1 mm). Radar data added to gage observations also increased the explained variance in point rainfall estimates above that from gages alone, from 53 to 77% and 46 to 72% for the above gage densities. entifiers: *Dielectric properties, Wet snow.

n accurate method of measuring liquid water in
ow covers is required to determine the proper-
s of wet snow. The dielectric properties of wet
ow must be utilized to adequately measure its
uid water content. In this study the effect of
uid water on the complex dielectric constant of
tural snow was determined in the microwave
equency range. Deloor's method for calculating
e dielectric constant for mixtures and the results
waveguide experiments on samples of wet snow
d glass beads were used to construct a calibra-
n curve relating the measured dielectric loss
ctor directly to the water content of wet snow.
ne results were independent of porosity, past his-
ry, and chemical impurities. A relation between
e effective dielectric constant and the porosity
d water content was proposed and tested experi-
entally. The general nature of this relation was
escribed and suggestions were made for the
evelopment of a more precise relation. It was
ncluded that the dielectric constant is a function
porosity and water content only. (Sims-ISWS)

now, one of nature's greatest reservoirs, supplies
ost of the usable water in the western United
tates. Reliable predictions of the quantity and
ming of the release of this water are used in mak-
g management decisions involving irrigation,
ock water and municipal water supplies, hydro-
ower generation, recreation, navigation, and pol-
tion control. Practically oriented research is vital for the proper development and management of this resource. In southwestern Idaho, the Northwest Watershed Research Center is conducting intensive investigations assessing snow volumes, snow water content, and snow-melt over a watershed. Application of these research findings should result in better development and management of the water stored as snow. (Roberts-ISWS)
W76-02412

USE OF AREAL SNOW COVER MEASUREMENTS TO DEVELOP SNOWMELT-RUNOFF RELATIONSHIPS FOR ARIZONA,
Arizona Univ., Tucson. Dept. of Watershed Management.
J. S. Aul.
Master of Science Thesis, 1975, 48 p, 11 fig, 4 tab, 25 ref, 3 append.

Descriptors: *Snow cover, *Runoff, *Streamflow forecasting, *Data collections, *Remote sensing, Areal, Snowpacks, Satellites(Artificial), *Arizona, Snowmelt, Runoff forecasting, Measurement, Forecasting.
Identifiers: *ERTS-1 imagery, *Earth Resources Technology Satellites, Black River Watershed(Ariz).

A study was conducted from November 1972 to June 1973 of the Black River Watershed, east-central Arizona, to determine whether ERTS-1 imagery could be used to monitor changes in areal snow cover for use in developing snow cover-runoff relationships for improved streamflow forecasting. Results indicated that despite some difficulties, ERTS-1 imagery could be interpreted for areal snow cover and that a highly significant relationship exists between snow cover measurements and subsequent runoff during the snowpack depletion period. Th two Earth Resources Technology Satellites presently in orbit repreat scans of an area once every nine days, and nearly one-half the scans during the study period were obscured by cloud cover. It was concluded that because of Arizona's shallow intermittent snowpack and the fact that large changes can occur rapidly, ERTS-1 imagery cannot be the sole source of data. Also, the delay in obtaining imagery needs to be overcome. The imagery could be interpreted by employing manual or semi-manual methods which could be available to those who would use snow cover data. 2D. Evaporation and Transpiration

ASSESSING SOIL-WATER STATUS VIA ALBEDO MEASUREMENT,
Agricultural Research Service, Phoenix, Ariz. Water Conservation Lab.
S. B. Idso, and R. J. Reginato.
In: Vol 4: Hydrology and Water Resources in Arizona and the Southwest, Proceedings of the 1974 Meetings of the Arizona Section, American Water Resources Association and the Hydrology Section, Arizona Academy of Science, April 19-20, 1974, Flagstaff, Arizona, p 41-54. 6 fig, 2 tab, 21 ref.

Descriptors: *Soil moisture, *Albedo, *Moisture content, *Soil surfaces, *Evaporation, Topsoil, Water balance, Water loss, Radiation, Soil physical properties, Soil water movement, Drying, Air-earth interfaces, Clay loam, Vegetation effects, Irrigation, Rainfall.
Identifiers: Bare soil albedo, Solarimeters, Soil drying.

Reliable information on soil-water status is required in order to make accurate water balance studies of watersheds, to determine the survival probabilities of various types of vegetation between rainfalls in low rainfall areas, and to determine the susceptibility of the uppermost soil to wind erosion. Simple solarimeters may help to accomplish this objective. Bare soil albedo was a linear function of the water content of a very thin surface layer of soil, and albedo correlated well with water contents of thicker soil layers. In addition, albedo measurements could be used to delineate the 3 classical stages of soil drying. Albedo may also be used to differentiate between the initial potential rate phase of evaporation following an application of water, and the succeeding falling rate phase. Results of applying this technique to a field of Avondale clay loam indicate that 20% to 25% of the water applied by either irrigation or rain will be lost by stage 1 potential evaporation, independent of seasonal variations in evaporative demand. Presently the techniques developed are applicable only to bare soil surfaces. (Robinett-Arizona)

Descriptors: *Evaporation, *Lake Huron, Energy budget, Mass transfer, Great Lakes, Energy, Heat flow, Advection, Lakes, Estimating.
Identifiers: *Lake evaporation, *Heat content, Global radiation, Long-wave radiation, Sensible heat, Heat storage, Standard error, Energy storage, Advected heat.

Evaporation was estimated for Lake Huron by the energy budget method and compared to available mass transfer estimates. Data from representative shoreline station measurements and vessel cruise measurements were collected. Agreement between evaporation by the energy budget and by mass transfer was reasonable from February through July, with the exception of May when measurement of the heat content was a problem. For the remainder of the year the disparity was marked. The principal difficulty encountered was the lack of meteorological measurements on the lake and adequate techniques to extrapolate the quantities from shoreline data. Quantitative monthly values for each component in the budget

equation were the first published for Lake Huron and one of the few sets available for the Great Lakes. (Roberts-ISWS)

SIMULATION OF EVAPOTRANSPIRATION AND DRAINAGE FROM MATURE AND CLEAR-CUT DECIDUOUS FORESTS AND YOUNG PINE PLANTATION,
Forest Serice (USDA), Franklin, N.C. Coweeta Hydrologic Lab.
L. W. Swift, W. T. Swank, J. B. Mankin, R. J. Luxmoore, and R. A. Goldstein.
Water Resources Research, Vol 11, No 5, p 667-673, October 1975, 3 fig, 7 tab, 23 ref. NSF AG-199, 40-193-69; NSF AG-389.

Descriptors: *Simulation analysis, *Evapotranspiration, *Drainage, *Deciduous forests, *Pine trees, *Appalachian Mountain Region, Soils, Atmosphere, Oak trees, Hickory trees, Hardwood, Watersheds(Basins), Vegetation, Meteorological data, Seasonal, Soil moisture, *Model studies.
Identifiers: *Phenomenological models, Watershed models.

Prosper, a phenomenological model of water exchange between soil, plant, and atmosphere, was used to simulate evapotranspiration and annual drainage for 2 years from a mature oak-hickory forest in the southern Appalachians. The simulation was tested by comparing drainage to measured streamflow. In a year of unusually high precipitation the simulated annual drainage was within 1.5% of measured streamflow. Simulations were also performed by using the same 2 years of meterologic data, but vegetation parameters were changed to represent a young white pine plantation and a regrowing hardwood forest one year after clear-cutting. The model estimated that drainage for an average rainfall year was reduced 20 cm by a 16-year-old white pine plantation and increased 36 cm by clear-cutting. These results were comparable to changes of -20 and +38 cm observed in watershed experiments at Coweeta Hydrologic Laboratory. Simulated evapotranspiration during the summer was nearly identical for hardwood and pine forests, while winter and early spring water loss was greater for pine. Simulation suggested that the greater evapotranspiration by pine was due to increased interception in all seasons and increased transpiration in the dormant season. For the clear-cut area, simulated evapotranspiration was considerably less than it was for the pine or hardwood forest and thus caused simulated soil moisture contents to be greater during the summer season. Semiarid environments exhibit certain hydrologic characteristics which must be taken into consideration for the effective modeling of the behavior of catchments in these areas. Convective storms, which cause most of the runoff, occur in high intensity and short duration during the summer months and are highly localized so that only a small portion of the catchment actually contributes flow to the storm hydrograph. Also, streams in semiarid catchments are ephemeral with flow occurring only about 1 percent of the time. This study attempts to develop a simple synthetic catchment model that reflects these features of the semiarid environment and for which (1) the simplifying assumptions do not preclude the inclusion of the important components of the runoff process, and (2) parameters of the equations representing the component processes have physical interpretation and are obtainable from basin characteristics so that the model may be applicable to ungaged sites. A reductionist approach is then applied in which the entire catchment is subdivided into a finite number of meshes and the various components of the runoff phenomenon are delineated within each mesh as independent functions of the catchment. Simplified forms of the hydrodynamic equations of flow are used to route flow generated from each mesh to obtain complete hydrograph at the outlet po (Robinett-Arizona)

EFFECT OF VEGETATION ON SOIL HUMIDITY IN EASTERN KARA KUM, (IN RUSSIAN),
Yu. M. Miroshinichenko.
Probl Osvoeniya Pustyn'. 2, 17-22, 1974. (English summary).

Descriptors: *Humidity, Microenvironments, *Vegetation effects, Soil surfaces, *Soil moisture, *Soil-water-plant relationships.
Identifiers: Caaligonum-microcarpum, Calligonum-setosum, Carex-physodes, Ephedra-strobilacea, Haloxylon-aphyllum, Kara-kum, USSR.

The humidity under Haloxylon aphyllum stands differs from that of various plant micro-groups. The humidity of soils in H. aphyllum microgroups (in undercrown areas) exceeds 4-5 times that of soils in Carex physodes microgroups. Humidity in soils under Ephedra strobilacea, Calligonum microcarpum, C. setosum exceeds that of C. physodes. Water accumulation in soils depends on sizes of the undercrown areas deprived of C. physodes under the influence of litter salts.–Copyright 1975, Biological Abstracts, Inc.

CHAPARRAL SOILS,
Forest Service, Berkley, Calif. Pacific Southwest Forest and Range Experiment Station.
L. F. DeBano.
In: Proc., Symposium on Living with the Chaparral, Riverside, Calif., 1973:19-34, April 1973. Sierra Club, San Francisco.

Descriptors: *Chaparral, *Fire, *Soils, Brush, Burning, Erosion, Fertility, Soil physical properties, Soil chemical properties, Nitrogen, Wettability, Runoff, Infiltration.
Identifiers: *Water repellent soils, *Wildfires, Plant nutrients.

The properties of chaparral soils vary widely, although many of them are shallow and relatively infertile. Wildfires produce changes in these soils which affect both their fertility and erosional properties. During fire, live plant material and the underlying litter are consumed, and the unavailable plant nutrients contained in this material are transformed into highly soluble forms in the remaining ash. These soluble nutrients may be used for subsequent plant growth after the fire or lost by erosion which has been accelerated by the fire. On many burned areas infiltration is decreased by a water-repellent soil condition. Water repellency is produced when organic substances, vaporized by the high fire temperatures (sometimes reaching 1,400F), coat the mineral soil particles. The lower infiltration rate of these burned soils causes water to run off and carry both soil and dissolved plant nutrients with it. The amount of different plant nutrients lost during fire and the impact of these losses on the natural fertility of chaparral areas is currently under study. (Forest Service-USDA)

FOREST SOIL,
Forest Service, Berkley, Calif. Pacific Southwest Forest and Range Experiment Station.
L. F. DeBano.
In: McGraw-Hill Yearbook of Science and Technology, p 204-206, May 1973. McGraw-Hill Book Co., New York.

Descriptors: *Wettability, *Organic matter, Infiltration, Erosion, Fire, Burning.
Identifiers: *Water repellency.

Organic matter is beneficial to clay soils because it aggregates the small particles thereby creating larger soil pores which provide better air and water movement. In contrast, in sandy soil organic matter coats the mineral particles making them water repellent. The decreased wettability restricts infiltration causing runoff and erosion. Water repellency can be produced by wildfires when some of the organic compounds in the plant litter are distilled downward into the underlying soil layers. (Forest Service-USDA)

MODELING SOIL WATER MOVEMENT FOR TRICKLE IRRIGATION,
Arizona Univ., Tucson. Dept. of Soils, Water and Engineering.
A. W. Warrick, and D. O. Lomen.
Available from the National Technical Information Service, Springfield, Va 22161 as PB-248 048, $3.50 in paper copy, $2.25 in microfiche. Project Completion Report, October 1975. 17 p, 14 fig, 3 tab, 21 ref. OWRT B-035-ARIZ(5). 14-31-0001-4058.

Descriptors: *Unsaturated flow, Irrigation, *Soil water movement, Equations, Evapotranspiration, Model studies, *Soil moisture, Flow rates, *Arizona, Flow measurement, Measurement, *Mathematical models.
Identifiers: Matric flux potential, *Moisture flow equations, Yuma(Ariz), Sinai Desert, *Trickle irrigation.

Solutions of the time dependent linearized soil moisture flow equation have been completed for point, line, strip, disc and ring sources. These solutions were used to simulate time dependent moisture regimes for various geometries used in trickle irrigation. They are also useful as a check for elaborate finite difference or finite element schemes for solving the non-linear moisture flow equations. For one-dimensional steady state flow, analytical solutions were obtained for seven types of plant water withdrawal functions depending on the flux potential as well as the depth below the surface. The solution of the linearized moisture flow equations with a point source has been compared with the finite difference solution of the non-linear equations of Brandt et al, as well as with field data measured on sandy soil in Yuma and the Sinai. These comparisons were very favorable but demonstrated that care must be taken in applying the model to problems involving large fluxuations in moisture content. Two field experiments for measuring evapotranspiration under trickle irrigation were made in citrus groves near Yuma. The objectives of these measurements were to study the water uptake distribution in the close vicinity of a tree and the microclimate of a grove under trickle irrigation. Data obtained during these field trips will be used to analyze the irrigation policy of the farmers in Yuma and to compare with the predictions of the corresponding mathematical models.

Descriptors: *Soil moisture, *Moisture content, *Stratification, *Soil analysis, *Soil horizons, Soil water, Soil physics, Soil types, Gravimetric analysis, Soil physical properties, Slopes, Statistical methods, Sampling, Stratigraphy.
Identifiers: *Stratified sampling, Mosgiel(New Zaland).

The variation of gravimetric moisture content within undrained experimental plots located in the gently rolling phase of Otokia silt loam near Mosgiel, New Zealand is examined. The effects of stratification of each plot into 3 hydrologic response zones are also examined in terms of the precision of the estimate of mean moisture content of the plot. Stratification of the sample of moisture content on the basis of change of slope significantly increased the precision of the estimate of the plot mean. If variability of moisture content in the future is similar to that of the samples analyzed, a sample size of 80 for the A and B horizons and 50 for the AB horizon will ensure a 95 percent confidence interval about the sample mean of not more than 2 percent moisture content. Identifiers: *Vertical diffusivity.

Vertical averaging, or averaging in a plane perpendicular to the mean flow, in environmental dispersion problems is desirable from the standpoint of efficiency of computer solution. A method is presented, based on computer solution of a model transport problem, for estimating when cross-plane averaging is appropriate. The method is applied to four examples representing typical lake rivers, estuaries and the atmosphere, respectivel The results are correlated in terms of a chara teristic length, velocity and turbulent diffusivit and two dimensionless parameters that depend the velocity and vertical diffusivity profiles. The parameters vary over a relatively small range f the variety of examples that are considered. (S also W76-02152)
W76-02155

CRITERIA FOR THE USE OF VERTICA AVERAGING IN GREAT LAKES DISPERSIO MODELS,
Cleveland State Univ., Cleveland, Ohio. Dept. Chemical Engineering.
F. M. Galloway, and S. J. Vakil.
May 1975, 33 p, 12 fig, 3 tab, 9 ref.

Descriptors: *Computer models, *Model studi *Lake Ontario, Lakes, *Dispersion, Diffusivit *Diffusion, Path of pollutants, Great Lakes.

A basic question in developing a dispersion mo is when can vertical averaging be used to redu the dimensionality of the problem, thus resulti in considerable savings of computer time. A mo problem involving horizontal convection and ve cal diffusion is solved on the computer to establi criteria for vertical averaging. Effective horizon dispersion coefficients (Ke), for use after verti averaging, were computed from the results of t model problem and also from a formula given Csanady. Both methods gave good agreement the values of Ke. Predicted values of Ke as a fu tion of horizontal length scale are in good agr ment with measured horizontal dispersion coef cients from dye release studies in Lake Ontar The mechanism involving vertical shear velocity and vertical diffusion may therefore be important as horizontal turbulence, or more so, producing horizontal dispersion. AN EVALUATION OF THE RAINBOW TROUT-WARMWATER SPECIES FISHERY IN PARKER CANYON LAKE,
Arizona Univ., Tucson. School of Renewable Natural Resources.
L. E. Otte.
Master of Science Thesis, 1975, 53 p, 11 fig, 5 tab, 29 ref, 5 append.

Descriptors: *Rainbow trout, *Fish, *Arizona, *Fsh management, *Fish stocking, Trout, Cold-water fish, Sport fish, Fishing, Channel catfish, Bass, Sunfishes, Fish conservation, Fish physiology, Fish populations, Fisheries, Ecology, Environmental effects, Warm-water fishing, Cold-water fishing, Recreation, Dissolved oxygen, Water temperature, Lakes.
Identifiers: *Parker Canyon Lake(Ariz).

Parker Canyon Lake, located in southeastern Arizona at an elevation of 1636 meters, was studied in relation to the biology and harvest of the stocked rainbow trout and their compatibility with the warmwater species of channel catfish, largemouth bass, green sunfish and bluegill, from October 24, 1973 through November 1, 1974. After stocking, the trout dispersed to the littoral areas around the lake, feeding primarily on zooplankton during the winter (December-February) and on midge pupae or larvae during the spring (March-May). Five monthly stockings of 8- to 10-inch rainbow trout began in November and by the end of April, 90 to 95 percent of all trout had been harvested from the lake. During the summer, dissolved oxygen was at least 3mg/l and temperature was 21C or less at a depth of 6 to 7 m. The littoral plant beds provided the warmwater species with food, cover and spawning sites throughout the year. Although food and habitat overlap occurred between rainbow trout and warmwater species, it did not adversely affect the fish, and the fishery of Parker Canyon Lake was biologically compatible. Stockings of rainbow trout only in the cooler months (December through February) would provide more fish for recreation by stimulating anglers to fish for warmwater species later in the fall and earlier in the spring, and thus maintain year-round fishing in the lake. LIMNOLOGICAL DATA FOR DONNER LAKE, CALIFORNIA, MAY 1973 THROUGH DECEMBER 1973,
Geological Survey, Sacramento, Calif.
A. E. Dong.
Open-file report, September 1975. 51 p, 2 fig, 11 tab, 5 ref.

Descriptors: *Limnology, *Lakes, *California, Basic data collections, Physical properties, Chemical properties, Biological properties, Lake morphology, Lake morphometry, Sampling, Chemical analysis, Hydrology.
Identifiers: *Donner Lake(Calif).

Data were collected in the spring of 1973 for definition of certain physical, chemical, and biological characteristics of Donner Lake, Calif. The lake probably was in an unenriched condition at the time of the study. Any future changes in the lake, caused by natural or human influences, can be related to the conditions documented in this report. Donner Lake in Nevada County is about 80 miles northeast of Sacramento. The lake has a surface area of 1.5 sq mi and lies at an altitude of 5,935 ft above mean sea level. The lake is regulated by a small dam and has a usable capacity of 9,500 acre-ft of water. The 14 sq mi drainage area consists of mostly coniferous forests. Three major inlets, Lakeview Creek, Billy Mack Creek, and Negro Creek, enter the lake from the west end of the lake. Donner Creek, outlets of the lake, received lake water below the dam at the east end of the lake and flows eastward into the Truckee River. The climate of Donner Lake basin is of highland type--winters are cold with abundant snowfall, and subzero temperatures are often recorded. The long-term average temperature is 26 deg F (-3 deg C) in January. Summers are cool and dry with a long-term average July temperature of 62 deg F (16 deg C). Long-term average annual percipitation is about 45 in. Average annual evaporation from the lake is about 36 in. Water samples were collected once monthly during May, August, October, and December; and twice monthly during June and July. (Woodard-USGS)

FOSSIL FISHES FROM THE PLICENE OR PLEISTOCENE CACHE FORMATION, LAKE COUNTY, CALIFORNIA,
Geological Survey, Menlo Park, Calif.
R. W. Casteel, and M. J. Rymer.
Journal of Research of the U S Geological Survey, Vol 3, No 5, p 619-622, September-October 1975. 2 fig, 26 ref.

Descriptors: *Lakes, *Fish, *Geologic time, *Pleistocene Epoch, *California, Freshwater fish.
Identifiers: *Lake County(Calif), *Fossil fishes, Cache formation, Fossil-current fish relationships.

The remains of fossil fishes comprising three species were found in the Cache Formation in Lake County, Calif. The rocks containing the fossils are considered to be late Pliocene or early Pleistocene. The species are all freshwater and primarily quiet-water types that now live in Clear Lake and the waters of the surrounding area, suggesting continuity between the present lake and a lake represented by the rocks of the Cache Formation. 2I. Water In Plants

SOME NEW ASPECTS OF PLANT INDICATION OF HYDROGEOLOGICAL CONDITIONS IN DESERTS, (IN RUSSIAN),
S. G. Laricheva.
Ekologiya, Vol 5, No 4, p 38-42, 1974.

Descriptors: *Deserts, *Hydrologic aspects, *Desert plants, *Groundwater, *Water utilization, Evaporation, Infiltration, Equilibrium, Transpiration.
Identifiers: Water exchange, Desuction.

In the light of new concepts on the types of water exchange in the zone of aeration, concepts of the interrelation between various ecological groups of sand desert plants and groundwater are examined. The possibility of plant indication of 4 types of water exchange in the zone of aeration is discussed. These are: the evaporative type, which indicates the expenditure of groundwater primarily due to physical evaporation; the infiltration type in which groundwater is supplied mainly by precipitation; the equilibrium type characterized by the absence of precipitation and consumption of groundwater; and the 'desuctive' type of water exchange which presumes the consumption of groundwaters by their 'desuction' (uptake by roots) and transpiration during physiological activity of plants.--Copyright 1975, Biological Abstracts, Inc.

STOMATAL MOVEMENT AND WATER RELATIONS IN CROPS: 2. STOMATAL BEHAVIOR OF TOBACCO LEAVES OF DIFFERENT AGES AND THE INFLUENCE OF SOIL WATER SHORTAGE, (IN JAPANESE),
Ehime Univ., Matsuyama (Japan). Coll of Agriculture.
S. Jodo.
Proc Crop Sci Soc Jap, Vol 42, No 1, p 123-130, 1973.

Descriptors: *Stomata, Crop production, *Leaves, *Tobacco, Soil moisture, Light, Solar radiation, *Xylem.
Identifiers: *Soil moisture stress(Plants).

Diurnal stomatal behavior was studied in 3 leaves (an upper immature, a middle immature, and a lower mature leaf) of a potted tobacco plant under greenhouse conditions using recording porometers, for 3 days. The effect of soil moisture stress (pF) upon stomatal behavior was also examined. Every morning, pre-dawn opening was evidently in the upper and middle immature leaves, but was hardly seen in the lower mature leaf. Stomatal opening markedly increased in every leaf with increasing light intensity after sunrise even under high soil moisture stress. The time of peak stomatal opening appeared earlier as the leaf became older. In the case of the immature leaf, the same phenomenon was seen under highest pF condition. These peaks showed a sharp shape by the shortening of their width (opening period) due to the occurrence of midday closure. The lower mature leaf showed marked midday closure of stomata at high light intensity even mild soil moisture stress pF 3.10, but the upper immature leaf scarcely showed midday closure. Soil moisture stress increment promoted the development of midday closure in depth and length in every leaf, especially in the upper and middle immature leaves. Average stomatal opening and opening period decreased with increasing leaf age and soil moisture stress. This resulted because a leaf water deficit was produced by internal (leaf age) and external (pF) conditions, and such deficit caused the midday closure and the suppression of reopening of tobacco stomata. A marked difference was found between the forenoon stomatal opening curve and the afternoon stomatal closing curve within the middle and lower leaves. Photoactive opening (including hydropassive opening) after sunrise and midday closure (hydroactive closing) under strong solar radiation occurred simultaneously in the tobacco stomata in 3 leaves. Such synchronism suggests that these stomatal behaviors were associated with the variation of xylem hydraulic tension.--Copyright 1974, Biological Abstracts, Inc.

CONIFEROUS STANDS CHARACTERIZED WITH THE WEIBULL DISTRIBUTION,
Forest Service (USDA) , Coweeta Hydrologic Lab. Franklin, N.C.
H. T. Schreuder, and W. T. Swank.
Canadian Jounral of Forest Research, Vol 4, No 4, p 518-523, July 1974. 6 p, 1 fig, 5 tab, 15 ref.

Descriptors: *Coniferous trees, *Statistical models, *Canopy, White pine trees, Loblolly pine trees, Biomass, North Carolina.
Identifiers: *Stand structure.

The Weibull distribution equation was employed to summarize diameter, basal area, surface area, biomass, and crown profile distribution data well for several different ages of white and loblolly pine plantations. The data for diameter, basal area, surface area, and biomass were easily summarized by this one distribution in a theoretically consistent fashion. This is not possible with the normal and the gamma distributions, and the lognormal gives less satisfactory results. The distribution function should prove useful in modeling tree stands since only the parameter values need to be change over time for the above variables. The change in these parameters may be a good way to characterize and interpret changes in stands over time. (Forest Service-USDA)

tifiers: Stereo photography, Flow patterns, r movement, Vesicular horizons.

practicability of using vertical, aerial photog-y to study erosion conditions on arid and arid range watersheds in the Great Britain was ied. Large scale (1:600) 70 mm sequential photographs in stereo pairs were used. Soil ce factors, applicable to erosion, which were ed using aerial photography included flow rns, wind erosion, litter movement, vesicular ons, bare ground, rills, and gullies. Using factors, ground observations were compared photographic data to develop descriptions, , and guidelines for the interpretation of each on condition. The interpretation guidelines loped lead to evaluations that are at least as rate as those currently being obtained on the nd. Costs involved in flight time and in-etation averaged less than 0.025 dollars per (0.01 dollars per acre). (Robinett-Arizona)

ifiers: Soil loss, Sediment yield prediction, ut Gulch Experimental Watershed(Ariz), ersal Soil Loss Equation.

An erosion prediction method that has recently received wide attention in the United States is the Universal Soil Loss Equation which is given as: A=RKLSCP. Where A = estimated soil loss (tons/acre/year), R = a rainfall factor, K = a soil erodibility factor, L = a slope length factor, S = a slope gradient factor, C = a cropping-management factor, and P = an erosion control practice factor. Data collected on the Walnut Gulch Experimental Watershed in Southeastern Arizona were used to estimate these factors for semiarid rangeland conditions. The equation was then tested with data from watersheds of 108 and 372 acres. The predicted value of annual sediment yield was 1.29 tons/acre/year as compared with an average 1.64 tons/acre/year for 4 years of data for the 108-acre watershed, and a sediment yield of 0.39 tons/acre/year was predicted for the 372-acre watershed as compared with the measured value of 0.52 tons/acre/year. Although good agreement was noted between predicted and actual sediment yield, additional work is needed before the equation can be applied to other areas of the Southwest. (Robinett-Arizona)

UNCERTAINTY IN SEDIMENT YIELD FROM A SEMI-ARID WATERSHED,
Arizona Univ., Tucson. Dept. of Systems and Industrial Engineering.
J. H. Smith, M. Fogel, and L. Duckstein.
In: Vol 4: Hydrology and Water Resources in Arizona and the Southwest, Proceedings of the 1974 Meetings of the Arizona Section, American Water Resources Association and the Hydrology Section, Arizona Academy of Science, April 19-20, 1974, Flagstaff, Arizona, p 258-268. 3 fig, 13 ref, append.

Descriptors: *Sediment yield, *Semi-arid climates, *Soil erosion, *Estimating equations, *Synthetic hydrology, *Rainfall-runoff relationships, Erosion rates, Sediment discharge, Erosion, Sedimentation rates, Sediments, Sediment load, Range management, Southwest U.S., *Arizona, Rainfall, Surface runoff, Rainfall-runoff relationships, Small watersheds, Streamflow, Mathematical models, Planning.
Identifiers: Storm duration, Atterbury watershed(Tucson Ariz), Peak flow, Universal Soil Loss Equation.

A stochastic model is presented for the prediction of sediment yield in a semi-arid watershed based on rainfall data and watershed characteristics. Random variables which lead to uncertainty in the model are rainfall amount, storm duration, runoff, and peak flow. Soil Conservation Service formulas are used to compute the runoff and peak flow components of the Universal Soil Loss Equation, and a transformation of random variables is used to obtain the distribution function of sediment yield from the joint distribution of rainfall amount and storm duration. Applications of the model are in the planning of reservoirs and dams where the effective lifetime of the facility may be evaluated in terms of storage capacity as well as the effects of land management of the watershed. In order to calibrate the model and to evaluate the uncertainties involved, experimental data from the Atterbury watershed near Tucson, Arizona were used. (Robinett-Arizona)

RELATION OF RESERVOIR SEDIMENTATION TO CATCHMENT ATTRIBUTES, LANDSLIDE POTENTIAL, GEOLOGIC FAULTS, AND PREDICTED DENSITY,
Forest Service, Berkley, Calif. Pacific Southwest Forest and Range Experiment Station.
H. W. Anderson.
In: International Symposium on the Hydrologic Characteristics of River Basin and the Effects on these Characteristics of Better Water Management. Proc. Tokyo Symposium December 1975, Int. Assoc. Sci. Hydrol. Pub. No. 117, 629-638, 1975.

Descriptors: *Erosion, *Deposition, *Sedimentation, Landslides, Geologic faults, Soil physical characteristics, Snow, Geology, Streamflow, Forest fires, Roads, Highways, Reservoirs, Watershed management, Geomorphology, Elevation, Slope, Forests, Brushlands, Flood frequency.
Identifiers: *Rural roads, *Grazing, *Trap efficiency(Reservoirs), Watershed shape, Channel slope.

A basis was developed for normalizing reservoir deposition accumulated during periods of widely different streamflow sediment producing potential in northern California. Long term records of the product of yearly mean and yearly maximum daily streamflow from nearby streams was used as a normalizing variable. The normalized sediment measurements in reservoirs were found related to streamflow, rain-snow frequency, road standards and locations, forest fire, and physiography. Deviations from this relation were found to occur with differences among watersheds in landslide classes on a published map of the U.S. Geological Survey, with extent of faults indicated on state geologic maps, and with reservoir density predicted from Wallis-Willen geology-soil-texture relations and Koelzer-Lara-Miller relations. Reduced rank principal component analyses were used throughout in the evaluations. The final prediction equation had an R2 of 0.86 and a standard error of estimate of 0.138 log units. Variations in average annual reservoir deposition associated with predicted density was 39 percent, with landslides 100 percent, with faults 41 percent, and with clay content by 32 percent, but only 38 percent with precipitation variation after adjustment to long-term flow and rain-snow frequency. Combinations of geologic rock-type and geologic faults and landslide potential have a predicted sediment rate as much as 17 times that of non-fault areas. (Forest Service-USDA)
W76-02288

SEDIMENTATION AND TURBIDITY HAZARDS IN WILDLANDS,
Forest Service, Berkley, Calif. Pacific Southwest Forest and Range Experiment Station.
H. W. Anderson.
In: Watershed Management, ASCE-1975 Proc. Watershed Management Symposium, Division of Irrigation and Drainage, Amer. Soc. Civil Engineers, Logan, Utah, August 11-13, 1975:347-376.

Descriptors: *Sedimentation, *Water quality, *Erosion, Landslides, Bank erosion, Roads, Topography, Geology, Suspended sediment,

Reservoir deposition, Turbidity, Forest fires, Logging, Lumbering, Watershed management, Geologic faults, Density of sediments, Streamflow frequency, Geology, Soil physical characteristics, Vegetation, Regression analysis, Principal component analysis.
Identifiers: Flood effects, Erodibility, Surface-aggregation ratio, Rain-snow frequency.

Results of current and older studies are reported to illustrate how sedimentation and streamflow turbidity hazards can be evaluated. Indices of sediment hazards, production coefficients that alter those hazards, and techniques for appraising sediment potential, both in terms of suspended sediment and in reservoir deposition, are applied. A system for selecting sediment and water quality units and defining a unit area on which water quality might be monitored and sedimentation predicted is developed. Five subsystems characterize the basic sediment producing potential of meteorological, geologic, topographic, vegetative, and land use condition. Another subsystem can be used to adjust to the full 81-year records, sedimentation measured during different periods. This was done by 'normalizing' the effects of streamflow, snowfall, elevation, and latitude in relation to rain-snow frequency. Coefficients have been developed for predicting the expected effects of logging, road building, forest fires, conversion of steep forest or brushland to grass, unstable stream channels, landslides, and geologic faults on sedimentation. (Forest Service-USDA)

RELATIVE CONTRIBUTION OF SEDIMENT FROM SOURCE AREAS AND TRANSPORT PROCESSES,
Forest Service, Berkley, Calif. Pacific Southwest Forest and Range Experiment Station.
H. W. Anderson.
In: Present and Prospective Technology for Predicting Sediment Yields and Sources. Proceedings Sediment-Yield Workshop, USDA Sediment Lab., Oxford, Miss., Nov. 28-30, 1972. U.S. Agric. Res. Serv. (Rep) ARS-S-40, p 66-73, 1975. 2 fig, 15 ref.

Descriptors: *Erosion, *Suspended sediment, *Sediment transport, *Sediment yield, Water quality, Turbidity, Bank erosion, Bedload, Mass wasting, Landslides, Watershed management, Lumbering, Forest fires, Soil texture, Channel morphology, Stream erosion, Headwaters, Vegetation effects, Brush control, Roads, Washouts, Slope stability, Geology, Abrasion.
Identifiers: Soil creep, Flood effects, Erodibility, Surface-aggregation ratio, Channel armouring.

Typically forest soils show wide variation in physical characteristics associated with the geologic origin of the parent material and variation in weathering processes. Soils anchored by tree roots often occupy slopes which would be beyond the natural angle of repose for the geologic material. The steep slopes are subject to an erosional process that consists of channel cutting over long periods, mass soil creep, and soil occasionally sliding from lower slopes into the channel. Each of these can be affected by land use. A study of suspended sediment discharge from 23 California watersheds estimated the following increases in sediment production associated with present average land uses as contrasted with absences of such land use in the watersheds: Conversion of 14.8 percent of steep forest and brush lands to grassland had multiplied sediment by 4.7; fires in the last 10 years on 5.3 percent of the watershed areas multiplied sediment by 2.3; 'poor logging' of 1.4 percent of the area increased sediment by 26 percent; and conversion of 0.6 percent of a watershed into low standard roads increased sediment by 24 percent. Thus, associated with these four factors of man's use was a total increase in sediment by a factor of 17 times. Under such conditions major floods can contribute to further deterioration in watershed conditions, as indicated by increased average sediment concentration. Sediment concentration, for like flows, was 2 to 3.7 times greater after the 1965 flood than before. High-elevation watersheds suffered more than low-elevation watersheds; sediment increases in high-elevation watersheds averaged three times that in low-elevation watersheds. Descriptors: *Sedimentation, *Clay minerals, Water pollution, Erosion, *Hawaii, Estuaries, Bays, Lagoons, Tidal streams, *Sinks, Watersheds(Basins), Environment, *Sediment yield, Sediment transport.
Identifiers: *Coastal sediments, Coastal environment.

The mineral composition as well as the texture of Hawaiian watershed and coastal sediments is dependent on various parameters. Geology, climatology, vegetation, stream slope and channel morphology, bathymetry, and cultural activities are important. Hawaiian streams enter the ocean basin through one of the following kinds of environment: estuaries, bays, lagoons, or mouths of tidal streams. The coastl environments serve as temporary sinks for the tidal streams. The coastal environments serve as temporary sinks for the sediments. Four representative watershed coastal environments from Oahu were selected for detailed study. They were Kahana, Kaneohe, Hawaii Kai, and Pearl Harbor.

Identifiers: Atmospheric ocean salts

Chemical analyses of rainfall were made for m constituents in samples collected at about mo intervals from 1963 to 1967 from four locatio Puerto Rico. Mean values and other statistics computed for chloride, bicarbonate, and calc which are the major ions in the rainfall. values for chloride, bicarbonate, and cal range from 2.8 to 5.0 milligrams per litre, 4.3 milligrams per litre, and 1.0 to 1.8 milligram litre, respectively. There is a higher concentr of dissolved solids during the dry season than ing the wet season. Poor correlation (r=0.20) found between the amount of rainfall an specific conductance. The data show that ther general decrease in the dissolved-solids conce tion in rainfall from east to west across the isl The ions present in rainfall contribute significa to the quality of surface waters. Computatio two basins show that virtually all the chlorid streamflow may be supplied from rainfall. tributions from rainfall range from 7 to 15 per for calcium, and from 16 to 63 percent for nesium. Sulfate contributions from rainfall r from 54 to 62 percent of the streamflow out (Woodard-USGS)

WATER-QUALITY ASSESSMENT OF THE DIANA DUNES NATIONAL LAKESHORE, I 74,
Geological Survey, Indianapolis, Ind.
L. D. Arihood.
Available from the National Technical Info tion Service, Springfield, Va 22161 as PB-245 $4.50 in paper copy. $2.25 in microfiche. W Resources Investigations 14-75, 1975. 56 p, 10 5 tab, 13 ref.

Descriptors: *Water quality, *Nati lakeshores, *Indiana, *Water supply, *Chem analysis, Data collections, Sampling, Sur waters, Groundwater, Marshes, Dunes, W chemistry, Nutrients, Aquatic microbiol Trace elements, Insecticides, Chemistry precipitation, Hydrogeology, Water pollu sources.
Identifiers: *Indiana Dunes National Lakesho

Precipitation samples collected from July 197 April 1974 at the Indiana Dunes Nati Lakeshore had an average inorganic ion con trations ranging from 0 to 7.0 milligrams per Streams in the National Lakeshore generally h specific conductance ranging from 300 to micromhos, a pH ranging from 6.5 to 8.1, a dissolved oxygen concentration near satura (7.7 to 12.9 milligrams per litre). The bogs marshlands generally contained water wit specific conductance ranging from 40 to micromhos, a pH ranging from 5.0 to 6.5, and solved oxygen ranging from 0.2 to 4.0 milligr per litre. Most surface waters tended to have c um and bicarbonate as the dominant ion pair. ceptions include some inter-dunal ponds and tain watercourses and areas of Pinhook Groundwater chemical quality varied with de and location but not with time during a 6-month terval. Groundwater was usually a calcium nesium bicarbonate type and moderate to hard (71 to 390 milligrams per litre). (Wood USGS)

ous aluminum solutions containing 0.45000 r aluminum in 0.01 molar NaCl04 were partly alized with NaOH to give OH:A1 mole ratios 1.40 to 2.76. Measured amounts of mont-lonite, kaolinite, volcanic ash, or feldspathic vere added to provide an area of inert surface. tions that occurred during 100 days of aging compared with those in similar solutions out added surfaces, studied in earlier work. rption of monomeric species A1(H2O)6, H(H2O)5, and Al(OH)2(H2O)4 on the added ces follows a cation exchange mass law ibrium model, and adsorption is essentially let in 1 hour. Only minor changes in meric aluminum species occurred after that. l adsorption of polynuclear aluminum oxide species also occurs and follows the pat-of the Langmuir adsorption isotherm. In the ce of surfaces, the polynuclear ions slowly ase in size and become microcrystalline ite during aging. Electron micrographs ed microcrystalline gibbsite was present on ces after aging only 2 days. However, the tical data suggest this materials must have adsorbed after it had already attained a near-alline state. Adsorbed polynuclear aluminum oxide species were not extensively converted icrocrystalline gibbsite during 100 days of . (Woodard-USGS)

Identifiers: *Colville River(Alas), Beaufort Sea, Hypersaline water.

The Colville River estuarine system was studied over a period of four years. Physical, chemical, geomorphological and biological features were included. North slope river deltas differ significantly from those elsewhere, due to climatological extremes and a long, cold, dart winter with continuous ice-cover and continuous daylight during the summer with melting ice or open water. Basic information has been obtained on the winds, waves and currents. Predominant durrent directions are from the west, with wind drift currents with a periodicity of 4 to 5 days. Beach sediments are characterized as poorly sorted gravelly sandy sediment in a relatively low energy environment. The ice-free biological regime is strongly influenced by the river input of low salinity water containing relatively high concentrations of nitrogen nitrients. An annual primary production in the estuary is estimated at 10-15 g-C/m2. Crustaceans, molluscs and polychaetes characterize the macrofauna at depths exceeding 2m, with but few species responsible for most of the biomass. Interesting features of the chemical regime are connected with the isolation of hypersaline water in the shallow estuarine and river system. Fresh water systems were included in the study. (EPA)

Identifiers: *Swash profiles, *Orbital motions, Power spectra, Swash currents.

Capacitance wave wires and miniaturized ducted current meters were developed to measure swash profiles and internal velocities directly on the beach face. Both sensors exhibited linear response and were rugged enough to withstand field conditions. Analysis of the data obtained from a linear array of these sensors along a very gentle beach profile was presented. Power spectrum variation in the upbeach direction revealed a low-pass filter effect of the beach along with an enhancement of power density in an infragravity frequency band. The difference between the swash cycle, i.e., the time a single wave takes to complete a return trip on the beach, and the incident wave period explained this latter effect, which may cause a higher wave run-up on a gentle beach than predicted from the incidence wave spectrum alone. Identifiers: *Wave direction measurement, Wave gaging.

The status of an effort to develop a nearshore wave direction gage with a noval principle of operation was reported. This point direction gage uses a thin pile in fairly shallow water to nonlinearly, but regularly, transform each steep incident crest, momentarily forming a bow wave. A few water level gages deployed around the
sense the bilaterally symmetric transforma
and then the symmetry direction of a data set
the gages is electronically estimated. Prelim
laboratory tests have indicated direction mea
ments of high precision may be made from
data on peak water level at a pile. Details of th
visioned instrument's operation were discu

NUMERICAL MODEL OF MATERIAL ANSPORT IN SALT-WEDGE ESTUARIES, RT 1. DESCRIPTION OF THE MODEL,
ological Survey, Menlo, Park, Calif.
B. Fischer.
ailable from Supt. of Documents, GPO, Wash, , 20402, price $1.25. Professional Paper 917, p , 1975. 5 fig, 10 ref.

scriptors: *Saline water, *Flow, *Estuaries, mputer models, *Computer programs, stems analysis, Methodology, Movement, Dis- ved solids, Model studies, Numerical analysis, atification, Path of pollutants.
ntifiers: *Salt-wedge movement.

Water in a salt-wedge estuary ideally is characterized by an oscillating well-mixed wedge of undiluted seawater topped by a series of successively more dilute overlying layers. In the wedge the flow is back and forth, with a net landward component to replace water entrained upward into the overlying layer; in the overlying layers the flow also oscillates, but with a net seaward component because of the input of fresh river water and entrained wedge water. The flow is modeled by a computer program, and the flow is used as an input to the constituent-transport model. The computer program then is used to determine the advection and dispersion of dissolved constituents and plankton, and their concentrations throughout the system in response to given inputs. The report describes required input data and method of operation of the computer program. (Woodard-USGS)

A NUMERICAL MODEL OF MATERIAL TRANSPORT IN SALT-WEDGE ESTUARIES, PART II. MODEL COMPUTATION OF SALINITY AND SALT-WEDGE DISSOLVED OXYGEN IN THE DUWAMISH RIVER ESTUARY, KING COUNTY, WASHINGTON,
Geological Survey, Tacoma, Wash.
J. D. Stoner, W. L. Haushild, and J. McConnell.
Available from Supt of Documents, GPO, Wash, DC, 20402, price $1.25. Geological Survey Professional Paper 917, p 13-36, 1975. 17 fig, 3 tab, 12 ref.

Descriptors: *Salinity, *Saline water, *Dissolved oxygen, Movement, *Estuaries, *Computer models, Washington, Systems analysis, Forecasting, Flow, Sewage effluents, Tracking techniques, Model studies, Tidal effects, Runoff, Path of pollutants.
Identifiers: *Salt-wedge movement, *Duwamish River estuary(Wash).

Saltwater from Elliot Bay on Puget Sound forms a wedge in the lower part of the Duwamish River estuary in Washington. The numerical model described by Fischer in Part I of this report was used in computing salinity distributions in the estuary, and oxygen-use rates and dissolved-oxygen distributions in the salt wedge. Computed spatial distributions of salinity agreed well with observed distributions during about 30 slack tides in July and August 1968. Analyses of the sensitivity of computed salinity to changes in model input parameters indicate that salinity changed most in response to changes in the wedge salinity and the location of the wedge toe. The model was used to predict the changes that would have occurred in the oxygen-use rate and DO concentrations in the wedge during June-September 1971 if discharge of Renton Treatment Plant effluent had been increased from a 1971 average of 37 cfs to the planned maximum of 223 cfs. The predictions suggest that (1) the oxygen-use rate would have been increased by 92 percent, (2) a relatively low DO concentration (4 mg/litre) would have been decreased by 45 percent, and (3) a relatively high concentration (9 mg/litre) would have been decreased by 8 percent. A proposed desalting plant is an engineering solution to the effects of a problem which could have been avoided and even now could be reduced on the farm. Water costing $125 per acre-foot will be delivered to Mexico to grow wheat, cotton, garden crops, alfalfa and safflower, of which the average value added per acre-foot was estimated at $80 for cotton and garden crops and $14 for wheat, alfalfa and safflower. The U.S. government, instead of building the desalting complex, could accomplish its purpose just as well by paying each farmer in the Yuma area, in return for the farmers reducing their drainage flow by whatever method they see fit, $114 per acre per year for the next 50 years. With proper management on the farm, the costs of managing salinity need not be high. (Robinett-Arizona)

Identifiers: Salinity control, Colorado River Water Quality Improvement Program, Colorado River International Salinity Control Project.

In the lower reaches of the Colorado River, damages from the increase in salinity to U.S. water users are now estimated to be about 53 million dollars per year and will increase to about 124 million dollars per year by the year 2000 if no salinity control measures are taken. Physical, legal, economic, and institutional aspects of the salinity problem and proposed actions to mesh alinity control with a total water management plan for the Basin are discussed. A scheme is presented for planning under the Colorado River Water Quality Improvement Program. Recent legislative action is also discussed which provides control plans to improve the water quality delivered to Mexico as well as Upper Basin water users. These efforts now under study will assure the continued, full utility of Colorado River water to U.S. users and Mexico. However, more extensive development of the Basin's natural resources puts new emphasis on total resources management through improved water and land use planning to conserve a most

precious western resource - water. (Robinett-Arizona)

FRESH WATER FOR ARIZONA BY SALT REPLACEMENT DESALINATION,
Arizona Univ., Tucson. Dept. of Hydrology and Water Resources.
A. B. Muller.
In: Vol 4: Hydrology and Water Resources in Arizona and the Southwest, Proceedings of the 1974 Meetings of the Arizona Section, American Water Resources Association and the Hydrology Section, Arizona Academy of Science, April 19-20, 1974, Flagstaff, Arizona, p 127-136. 2 fig, 10 ref.

Descriptors: *Desalination, *Water chemistry, *Desalination processes, *Membrane processes, *Reverse osmosis, Water treatment, Water purification, Desalination plants, Costs, Saline water, Water supply, *Arizona, Cost comparisons, Solvent extractions, Water yield.
Identifiers: *Salt replacement desalination, Replacer chemical, Ultrafiltration, High flux membranes, Energy requirements, Fixed gel syneresis.

The process of salt replacement desalination proposed is believed to be able to produce vast quantities of fresh water be desalination. This method, which is a novel approach to minimizing the costs of saline water conversion, consists of the substitution of solutes in a solution to be desalted by a replacer chemical, and the low energy removal of that replacer chemical. The ultrafiltration of larger molecular sized replacer chemicals with high flux membranes increases the produce yield rate and reduces the corresponding energy requirement, with respect to reverse osmosis. In addition, the initial captial investment is less since no pressure constraining devices are required. The alteration of the osmotic pressure of the replacer solution within the process can also take advantage of energy savings through the utilization of an easily reversible reaction which synthesizes and breaks down a constituent that has a significant osmotic pressure difference between phases. Finally, the unusual process of fixed gel syneresis shows potential as a low energy salt replacement type process, but still requires extensive investigation. (Robinett-Arizona)

CLEANING OF MEMBRANE SURFACES,
Universal Oil Products Co., Des Plaines, Ill. (Assignee).
J. L. Jennings.
U.S. Patent No 3,912,624, 4 p, 2 fig, 5 ref; Official Gazette of the United States Patent Office, Vol 939, No 2, p 931, October 14, 1975.

Descriptors: *Patents, *Membranes, *Reverse osmosis, Water quality control, Water pollution control, Separation techniques, Industrial wastes, Cleaning, *Desalination, Waste water treatment.
Identifiers: Water droplets, High velocity air flow.

The invention provides an improved rapid method for cleaning the membrane surfaces of a membrane separation unit after being in use, which comprises the steps of: partially filling the fluid passageways with water and then purging with air at a superatmospheric pressure to cause water droplets to move at high speed over the membrane surfaces and remove accumulated materials; and repeating the operation of the preceding step to effect a substantial removal of all accumulated materials and substanially all water droplets from the membrane surfaces without permitting any drying of the membrane. In connection with reverse osmosis systems, it may be advisable to initially effect a removal of pressure through the system and permit an osmotic back-flush through the membranes in order to provide an initial lifting or loosening of accumulated material. After permitting the back-flush procedure, then there may be the repeated purgings of fluid passageways and membrane surfaces with high speed air and entrained water droplets. Only a few minutes of operation will be needed for each purging stage and in many instances the entire cleaning procedure may be completed in approximately 10 minutes. (Sinha-OEIS)

LABORATORY EVALUATION OF WATER-REPELLENT SOILS FOR WATER HARVESTING,
Agricultural Research Service, Phoenix, Ariz. Water Conservation Lab.
D. H. Fink.
In: Vol 4: Hydrology and Water Resources in Arizona and the Southwest, Proceedings of the 1974 Meetings of the Arizona Section, American Water Resources Association and the Hydrology Section, Arizona Academy of Science, April 19-20, 1974, Flagstaff, Arizona. p 55-63, 4 tab, 7 ref.

Descriptors: *Soil surfaces, *Water harvesting, *Water yield improvement, *Materials testing, Arid climates, Rainfall-runoff relationships, Water yield, Runoff, Rainfall, Soil types, Laboratory tests.
Identifiers: *Water repellent soils, Paraffin wax, Dust suppressant.

Reported are laboratory evaluations to screen water-repellent materials and treatments before testing them in the field. Water repellency tests were conducted on paraffin wax, a wax emulsion and silicon, lard, and a liquid dust suppressant. Six water repellency tests showed that the high rates of paraffin wax and all rates of the dust suppressant produced highly water-repellent soil surfaces. The six water repellency tests were: (1) the aqueous-alcohol drop test for determination of the 90 degree surface tension for a porous solid, (2) the water drop penetration time test, (3) the relative height of a large sessile water drop resting on the smoothed, treated soil surface, (4) and (5) the presence and persistence of air bubbles trapped between the soil-water interface, and test (6) was made to note whether the large sessile water drop from test (3) would infiltrate the soil or evaporate. Tests (3), (4), and (5) proved the most useful of the six methods for measuring water repellency. Soil type had no significant influence on degree of water repellency as measured in the laboratory by these six tests. (Robinett-Arizona)

Descriptors: *Antitranspirants, Water consu tion, Colorado, New Mexico, Evaluation, Run *Phreatophytes, Evapotrans *Evapotranspiration control, Thin films, *W yield improvement, *Watershed management. Identifiers: Bernardo(N Mex), *Salt cedar.

Experiments were performed in the laboratory in the field to determine the effectiveness of 3 ferent types of film forming antitranspirant reducing the evapotranspiration f phreatophytes, with special emphasis on cedar. The antitranspiranats tested were M Leaf (Mobil Chemical Co.), wilt proof (Nur Specialty Products) and XEF-4-3561 (Dow C ing Corp.). The laboratory experiments indic that a single antitranspirant treatment can re the water loss from salt cedar by as much as for several days and that the long term ef tivenss of Mobil-Leaf is significantly better that of the other two antitranspirants. None o plants treated with Mobil-Leaf showed discoloration or other physiological injury wit month after treatment. Field studies with Mo Leaf were conducted in cooperation with the reau of Land Management at the E Evapotranspirometer Installation of Berna New Mexico. The decrease in evapotranspira from salt cedar observed in the field was less that in the laboratory and current indications that the resulting water savings was prob somewhat less than 30%. It is possible that the ference between laboratory and field effects is to a lack of uniformity and thoroughness of spray covering.

UNITED STATES-MEXICO WATER AGREEMENTS AND RELATED WATER USE IN MEXICALI VALLEY: A SUMMARY,
Arizona Water Resources Research Center, Tucson.
K. J. DeCook.
In: Vol 4: Hydrology and Water Resources in Arizona and the Southwest, Proceedings of the 1974 Meetings of the Arizona Section, American Water Resources Association and the Hydrolgoy Section, Arizona Academy of Science, April 19-20, 1974, Flagstaff, Arizona, p 78-93. 2 fig, 27 ref.

Descriptors: *Colorado River, *Desalination, *Mexico, *Salinity, *Planning, Mexican Water Treaty, Colorado River Compact, Alternative planning, Water utilization, Water management(Applied), Saline water, Water quality, Water pollution sources, Drainage water, Irrigation water.
Identifiers: *Mexicali Valley(Mex), Water agreements.

A summary is given of interrelated, technical and institutional events concerning the Colorado River which took place between the United States and Mexico from 1849 to 1974 with emphasis on the 1961-1974 period. Until the treaty of 1944, Mexico had had no guarantee of a specific annual quantity of water, but in the years after 1945, when a guarantee of 1.5 million acre-feet per year was established, more than that amount was available for use. Salinity problems arose, and in 1965 an agreement for a 5-year plan for alleviating the technical and political difficulties surrounding the salinity question was made. In 1973 it was agreed that the United States would build, within approximately 5 years, a facility for desalting the saline drainage water entering Mexico. Fulfillment of the technical provisions for this Agreement requires, in any event, the timely provision of federal funds to construct and operate the physical works. The several states should receive assurance that their rights and those of their respective water users will not be impaired within the legal operation of the Agreement. (Robinett-Arizona)

Identifiers: Desert cities, Tucson(Ariz).

Four sources of water supply for desert cities are rainfall, runoff, groundwater, and imported water, and the potential use for each varies. The government can institute various policy changes to eliminate or reduce the imbalance between water supply and demand. Restrictions should be placed on water-use luxuries such as swimming pools, subdivision lakes, fountains, etc. Water pricing should be progressive; each unit of increased use above a reasonable minimum should be charged for at an increasing rate. Runoff from individual properties, homes, storage, and supermarkets should be minimized through the use of onsite recharge wells, and various collection methods should be initiated. A campaign to acquaint the general public with a new water policy must be inaugurated. (Robinett-Arizona)

Descriptors: *Water reuse, *Water conservation, *Electric power production, *Nuclear powerplants, *Cooling water, *Water sources, Water resources, Water management(Applied), Water supply, Water utilization, Water requirements, Hydroelectric power, Electric power, Efficiencies, Electric power demand, Industrial water, *Arizona, Potential water supply.

An examination of potential water sources for power plant cooling in Arizona is presented along with information pertinent to Arizona's future water needs relative to electrical usage growth. It has been projected that Arizona's peak electrical power demands in 1980 and 1990 will exceed that of 1970 by some 5000 megawatts and 16000 megawatts of electricity respectively. At present, the bulk of the electrical energy generated in the western states originates at hydroelectric installations. Utilization of nuclear reactors for power generation requires a larger amount of cooling water than is required for a comparable fossil-fueled plant. It is suggested that the utilization of reclaimed wastewater for cooling purposes is a viable and attractive alternative to groundwater pumpage from both economic and ecological standpoints. Savings arise from conservation of fuel normally required for well pumps, costs of well construction are not required, quantities of fresh water should be released for consumption by alternate users, and a previously unused resource would be effectively recycled. ncy, *Irrigation canals, *Weirs, Concrete
ures, Water distribution(Applied), Remote
ol.

ithdraw water from an irrigation canal or
litch for distribution to a number of field cor-
ons, a weir is installed in the canal to contain a bifurcated water check or dam pointed downstream of the water flow in the canal. The bifurcated water check or dam forms an upstream pool of water to be withdrawn and distributed to the corrugations. The weir includes a valved outlet adjacent the upstream portion of the bifurcated dam, and outflowing water from the pool is conducted to a distributor conduit extending generally parallel alongside the canal at the head ends of the corrugations. The conduit includes a tube for each corrugation to conduct water from within the conduit to the corrugations. (Sinha-OEIS)

DRIP IRRIGATION SYSTEM AND COMPONENTS THEREOF,
Xeros Controls, Azusa, Calif. (Assignee).
A. P. Hardison.
U.S. Patent No 3,910,500, 7 p, 12 fig, 4 ref; Official Gazette of the United States Patent Office, Vol 939, No 1, p 230, October 7, 1975.

Descriptors: *Patent, *Irrigation systems, *Surface irrigation, *Irrigation practices, Irrigation efficiency, Filters, Filtration.
Identifiers: *Drip irrigation, Sand filters, Backwash.

A drip irrigation system is described in which the delivered water is filtered so that it is substantially free of particulate matter of troublesome size and still flows through the system with a relatively low-pressure loss. The system comprises in combination: an inlet conduit to receive a supply of water to be distributed; a sand filter system adapted to be backwashed connected to the inlet conduit; a manifold receiving filtered water from the filter system; a number of distribution conduits connected to and receiving water from the manifold; and at least one emitter connected to each distribution conduit for emitting water. Optional features of the invention provide the system with adjustments for control such as a penetrable self-sealing plug and a gauge with a probe adapted to penetrate the plug for measuring the pressure in the distribution conduits. Another feature is a filter arrangement where a portion of a sand filter system can be backwashed while another portion of the system continues to supply filtered water for irrigation. Another option is the provision of downstream retention screens together with sight-glasses for visual inspection of the condition of the screens to assure that the upstream filter means have not broken down. METHOD AND APPARATUS FOR CONTROLLED DRIP IRRIGATION FROM CHAMBER MEANS LOCATED AT VARYING ELEVATIONS ALONG SOIL AREAS TO BE IRRIGATED,
E. S. Pira.
U.S. Patent No 3,912,165, 8 p, 14 fig, 9 ref; Official Gazette of the United States Patent Office, Vol 939, No 2, p 786, October 14, 1975.

Descriptors: *Patents, *Irrigation, *Surface irrigation, *Subsurface irrigation, *Irrigation practices, Irrigation systems, Fluid friction, Pressure, Irrigation design.
Identifiers: *Drip irrigation.

A method and apparatus is described for furnishing fluid material throughout an irrigation system in a manner such that discharge of substantially uniform volumes of fluid may be realized at a number of discharge outlets located at varying distances from a pressurized fluid source and occurring at elevational differences of a significant nature. Water, under relatively high pressure, is first conducted through a pressure-reduction stage connected to the chamber body. Discharge of water takes place at spaced apart dripper outlets connected into the chamber body. The total volume of water discharged from the chamber and the degree of pressure drop are controlled in relation to one another to reduce and maintain the flow rate within a specific range of low velocity flow rates at which no appreciable friction losses take place with water being discharged uniformly at all dripper outlets. Within the low velocity range of flow rates, certain classes of dripper outlets, i.e. dripper outlets of short orifice length, tend to become sensitive to certain other small pressure changes induced, for example, in chamber portions occurring at lower elevations than other chamber portions. There may occur loss of uniformity of discharge. Uniform release of material through all of these dripper outlets of short orifice length is realized by releasably confining a small column of water in the path of flow exiting from the dripper outlets. (Sinha-OEIS)
W76-02256

AUTOMATICALLY OPERATED WATER DISTRIBUTION SYSTEMS SUCH AS LAWN AND GARDEN SPRINKLING SYSTEMS AND TIMER OPERATED VALVE THEREFOR,
D. R. Simon.
U.S. Patent No 3,912,167, 4 p, 7 fig, 5 ref; Official Gazette of the United State Patent Office, Vol 939, No 2, p 787, October 14, 1975.

Descriptors: *Patents, *Irrigation, *Sprinkler irrigation, *Irrigation efficiency, Water distribution(Applied), Control systems, Timing, Valves.

This invention related to timer operated valve mechanisms, particularly to those adaptable for use in automatic sprinkling systems. In a preferred system a number of such valves are connected to a source of water under pressure in a series arrangement. Each valve includes a manually settable timer for selecting the discharge period of its associated valve, and a water flow operated release means for initiating the cycle of the timer. Setting the timer serves to connect the valve inlet to a discharge outlet and to block a by-pass outlet. When the water supply to the system is turned on, water flows through the discharge of the first valve in the series and initiates the cycle of its timer. At the end of the set time period, the timer causes the valve to block the discharge and open the by-pass thereby supplying water to the second valve in the series. Each valve in the series cycles in this manner for a period determined by the setting of its associated timer. The last valve in the series may have its by-pass outlet capped thereby providing for automatic termination of the watering cycle. (Sinha-OEIS)
W76-02257

IRRIGATION SYSTEMS,
Conflow Irrigation Systems, San Diego, Calif. (Assignee).
H. G. Lodge.
U.S. Patent No 3,912,169, 4 p, 9 fig, 6 ref; Official Gazette of the United States Patent Office, Vol 939, No 2, p 788, October 14, 1975.

Descriptors: *Patents, *Irrigation, *Irrigation systems, *Irrigation practices, *Irrigation efficiency, Water distribution(Applied), Irrigation design, Distribution systems, Trees.

This invention provides an irrigation system which is particularly suitable, but not limited to, the irrigation of trees and is so arranged that a series of irrigation devices may be arranged for the supply of water to each tree, each device being individually adjustable to meet the needs of its cor-

responding tree, the water being discharged onto the ground in small streams to eliminate runoff or drift of water during severe wind conditions. The irrigation system utilizes a novelly arranged irrigation device in which a single valve controls the water supply to a manifold having a number of outlets, thus permitting the use of a larger valve which is less likely to be obstructed by particulate matter, the valve and manifold also arranged to cause turbulent flow within the manifold which effect substantial pressure reduction below supply pressure, permitting further increase in valve port opening for a given outlet flow. The irrigation device, contains manifold outlets connected to a set of highly flexible distributor tubes of small diameter which are capable of conforming to the ground surface or being superficially covered. The tubes are of such length that their discharge ends may be located in a uniform pattern within the drip line of the tree or other pattern best suited to the needs of the tree. The distributor tubes may be tied in knots to reduce or close off flow, or joined together by a sleeve to close off a pair of tubes, or joined to a larger tube to extend the range. (Sinha-OEIS)
W76-02258

LIGHTWEIGHT TRAVELING IRRIGATION SYSTEM,
R. F. Reinke.
U.S. Patent No 3,912,170, 4 p, 3 fig, 2 ref; Official Gazette of the United States Paten Office, Vol 939, No 2, p 788, October 14, 1975.

Descriptors: *Patents, *Irrigation systems, *Sprinkler irrigation, *Irrigation practices, *Irrigation efficiency, Irrigation design, Lateral conveyance structures, Structural stability, Aluminum alloys.
Identifiers: Traveling irrigation systems.

A lightweight irrigation system is described. The system is comprised of flexibly coupled, aluminum pipe sections which are supported above ground by electrically powered, wheeled carriage assemblies also made of aluminum and located at predetermined intervals along the pipe. Each pipe section has a number of interconnecting aligned pipe segments. The pipe sections are supported between carriages by a system of V-jacks and tie rods which work in combination with the pipe to maintain the pipe and carriages in stability and to prevent wallow or wind-whip of the pipe. The tie rods, which extend generally lengthwise of the pipe, are constructed of material having good strength properties and having a thermal coefficient of linear expansion substantially less than that of the aluminum in the pipe such as high quality steel with good corrosion resistance properties. The stie rods serve to maintain the integrity of the overall system against the relatively large thermal expansion and thermal contractin effects experienced by the aluminum components in response to extreme temperature variations. (Sinha-OEIS)

Descriptors: *Patents, *Irrigation, *Sprinkler irrigation, *Irrigation practices, Irrigation operation and maintenance, Water management(Applied).
Identifiers: Inpulse-type sprinkler.

A device for mounting a sprinkler to a riser is described wherein the riser has a smooth cylindrical inner surface of constant diameter. The device comprises a sleeve that includes an elongated cylindrical outer surface having a cross-sectional diameter less than the diameter of the cylindrical inner surface of the riser and further includes an inner bore of a prescribed diameter that extends the full length of the sleeve. A water delivery tube is included, either as an element of the device or as an element of the sprinkler head. The delivery tube includes a downward-open tubular section that extends through the inner bore of the sleeve. This tubular section includes a cross-sectional outside diameter substantially less than the diameter of the bore within the sleeve. An annular gasket on the sleeve is provided to enable a watertight seal to be formed between the sleeve and riser when the sleeve is inserted into the riser. Another gasket is provided on the sleeve within the bore to facilitate a watertight seal between the sleeve and the water delivery tube. Means to fasten the sleeve and the water delivery tube securely are included. (Sinha-OEIS)

THE EFFECTIVENESS OF PRESOWING FLOODING OF THE RICE FIELDS IN KZYLORDIA OBLAST, (IN RUSSIAN),
A. Ibraev, A. M. Nurgizarinov, I. Zh. Arystanov, A. S. Kim, and K. Baimbetov.
Izv Akad Nauk Kaz SSR Ser Biol. 5 59-63. Illus. 1974.

Descriptors: *Rice, Field crops, *Flooding, Flood irrigation, Crop response.
Identifiers: Kazakh-SSR, Kzyl, USSR.

The study was conducted in weedy rice fields in the Kazakh SSR, USSR. April flooding of rice fields reduced the weeds (such as reeds), increased the germination capacity of the seeds, accelerated the development of the plants and increased the rice yield. Thus pre-sowing flooding of the rice fields ensured an increase in the yield by preserving the nutritional substances of the soil such as humus.--Copyright 1975, Biological Abstracts, Inc.

Available from the National Technical Information Service, Springfield, Va 22161 as PB-248 044, $4.50 in paper copy, $2.25 in microfiche. Completion Report, July 1975. 49 p, 3 fig, 8 tab, 12 ref, append. OWRT A-041-SDAK(1). 14-31-001-3842.

Descriptors: *Pipelines, Water conveyance, Networks, Cost analysis, Value engineering, Optimization, *Linear programming, Hydraulic engineering, Irrigation, *South Dakota, Pipes, *Design criteria, Irrigation design.
Identifiers: Lagrange multiplier, Shamrock Irrigation Project(So Dak), Branched pipe networks.

The linear programming technique was applied to design an existing water conveyance project--The Shamrock Irrigation Project. An analytical method was developed to obtain a solution which is an adequate approximation to the solution found by linear programming. The analytical method enables the design engineer to select appropriate size of a complex branched pipe network without using the computer. The application of both methods to the Shamrock Irrigation Project was presen
comparison. (Wiersma-South Dakota State)

Alternative water use.
Identifiers: *Rural water supply systems.

Agricultural production is dependent to a la
tent on the availability of an adequate
supply. Production is not only limited by t
of vegetative cover for grazing, but also
lack of adequate drinking water. Data are
on costs of present systems, what crite
needed to estimate the cost of these syste
on the cost of alternate water supply syst
livestock producing areas. Personally co
surveys in Stanley and Haakon Counties,
Dakota revealed that water us is 86 perc
livestock (mainly beef cattle) and 14 perc
domestic use. Presently water in the over
lion acre area is supplied from 2349 dar
shallow wells and 54 deep wells. Average
water system cost is $7740 per rancher or
calf sold. Ninety-three percent of the varia
annual water system cost per rancher can
dicted from the number of dams. Total ar
acres and animal units also are reliable crit
predicting annual water cost. Annual c
selected community water supply system
from $1800 to $2400 per rancher pe

FLOODFLOW CHARACTERISTICS AT PROPOSED BRIDGE SITE ON MOHAWK RIVER, WHITESBORO, NEW YORK,
Geological Survey, Albany, N.Y.
B. Dunn.
Open-file report 75-442, September 1975, 5 p, 1 fig.

Descriptors: *Hydrologic data, *Streamflow, *Flood discharge, *Bridge design, *New York, Design flood, Planning, Evaluation, Design data, Bridge construction, Sites.
Identifiers: *Mohawk River, *Whitesboro(NY), Proposed bridge site.

New York State Department of Transportation plans to relocate a section of County Highway 30 in the towns of Marcy and Whitestown in Oneida County. Two alternate sections that would eliminate a series of broken-back and reverse curves and replace the present structures over the Mohawk River and the New York State Barge Canal are proposed. The planned bridge over the Mohawk River at Whitesboro is identical for alternate plans 1 and 2. The design-flood discharge for the proposed bridge site would be 18,200 cfs (515 cu m/sec), which is about equal to the discharge for the 100-year flood. The elevation at the bridge site for the flood of October 2, 1945, was 411.8 feet (125.5 metres). Alternate-bridge designs 1 and 2 would cause 0.2 foot (0.06 metre) increase in water level. (Woodard-USGS)

FLOODFLOW CHARACTERISTICS AT PROPOSED BRIDGE SITE ON WEST BRANCH DELAWARE RIVER, DELHI, NEW YORK,
Geological Survey, Albany, N.Y.
B. Dunn.
Open-file report 75-441, September 1975, 9 p, 4 fig, 1 tab, 3 ref.

Descriptors: *Hydrologic data, *Streamflow, *Flood discharge, *Bridge design, *New York, Design flood, Planning, Evaluation, Design data, Bridge construction, Sites.
Identifiers: *West Branch Delaware River(NY), *Delhi(NY), Proposed bridge site.

New York State Department of Transportation plans to build an access road from State Highway 10 to the Valley Campus of the State University Agricultural and Technical College at Delhi. This access road would cross the West Branch Delaware River at Delhi, about 750 ft upstream from the present Sherwood Road bridge. The 100-year, design-flood discharge at the proposed bridge site sould be 9,300 cfs (260 cu m/sec). Elevation for the 100-year flood at the site would be 1,345.1 feet (410.0 metres) above mean sea level. Increase in water level upstream from Sherwood Road bridge for the 100-year flood would be 1.2 feet (0.4 metres). Increase in water level caused by the various openings of the proposed bridge would range from 5.6 feet (1.7 metres) to 1.1 feet (0.3 metre) at the approach section. (Woodard-USGS)

WATER RESOURCES INFORMATION NEEDS FOR THE NORTHWEST FLORIDA WATER MANAGEMENT DISTRICT.
Geological Survey, Tallahassee, Fla.
Northwest Florida Management District Tallahassee, 1975, 68 p, 31 fig, 12 tab, 12 ref.

Descriptors: *Water resources, *Hydrologic data, *Florida, *Information retrieval, Surface waters, Groundwater, Water quality, Water demand, Water utilization, Water conservation, Hydrology, Hydrogeology.
Identifiers: Northwest Florida, Water information summary(Fla).

This report summarizes the availability and applicability of existing water resources information to the functions and needs of the Northwest Florida Water Management District. For those parts of the District where data are not already available it outlines the network extensions and the investigations needed to obtain such data. Where some data are available currently but where exigencies of basin management will require detailed or sophisticated information on intermediate-term or long-term programs, the investigations are outlines to afford at least a start in acquiring these data. From the Aucilla River, east of Tallahassee, the 16-county Northwest Florida Water Management District extends 200 miles westward to the Perdido River and the Alabama-Florida state line. The north-south dimension of

LIBRARY U. OF I. URBANA-CHAMPAIGN

the District is 40-45 miles except at the bulge of the Apalachicola Cape where it is 90 miles. The District is bounded in the north by Alabama and Georgia and on the south by the Gulf of Mexico. (Woodard-USGS)

PUBLIC AND INDUSTRIAL WATER SUPPLIES IN SOUTHERN MISSISSIPPI--1974,
Geological Survey, Jackson, Miss.
J. A. Callahan.
Mississippi Board of Water Commissioners, Jackson, Bulletin 75-2, 1975. 59 p, 5 fig, 11 ref.

Descriptors: *Groundwater resources, *Surface waters, *Water supply, *Water quality, *Mississippi, Basic data collections, Water wells, Aquifers, Well data, Water storage, Reservoirs, Water treatment, Industries, Municipal water, Domestic water.
Identifiers: Southern Mississippi.

Total public- and industrial-supply pumpage in the 37 counties of southern Mississippi amounted to 1,920 mgd (84.1 cu m/sec) in 1974. Of the 1,680 mgd (73.6 cu m/sec) pumped from surface-water sources, 792 mgd (34.7 cu m/sec) were brackish water from Back Bay of Biloxi and the Pascagoula River estuary. Public water supplies at Jackson and Meridan use both surface water and groundwater. All other public supplies use groundwater. The groundwater is obtained from aquifers of Eocene age and younger. Although the greater number of industrial supplies are obtained from Miocene aquifers, most of the water pumped for industrial use is from surface sources. (Woodard-USGS)

SURVEY PROBLEMS ALONG THE CALIFORNIA-ARIZONA BOUNDARY,
California State Lands Div., Sacramento. Granted Lands and Area Projects.
R. Minnick.
In: Proceedings of the American Congress on Surveying and Mapping, Fall Convention, October 26-31, 1975, Phoenix, Arizona, p 54-61, (1975), 1 fig, 6 ref.

Descriptors: *Colorado River, *Boundaries(Property), *Arizona, *California, *Land tenure, Legal aspects, Adjacent land owners, Boundary disputes, Water law, Water rights, Land, Land use, Real property, Land management, Decision making, Planning, Channels.

The State of California owns the western half of the Colorado River separating Arizona and California, but to date the property boundaries are still unclear and unmapped. Private landowners are confused; California owns sovereign land in Arizona, and Arizona owns sovereign land in California. In addition, there are Indian and Federal Government land claims. The California State Lands Commission has begun a surveying and mapping program which will attempt to solve these boundary problems. Methods used in establishing surveying and mapping claim lines in the River are discussed. In making decisions on a particular site, questions such as these had to be answered: What is the last natural channel of the River. What effect have the dam and levees had. Is the River in a cut. And, what court cases affect this particular set of facts. These, along with any other facts pertaining to ownership, title, and boundaries, are assembled into a claim line study that draws inferences and discusses alternative claim lines and the support and weight given to each from the assembled facts. Maps, air photos and overlays are assembled from which decisions are made firmly enough so that the claim can be asserted in court if need be. Field work is then planned, surveying is done, and maps are completed and approved by the State Lands Commission. (Robinett-Arizona)

oc Hill is an 869-acre desert area near Tuc-
izona which is being considered as a con-
access environmental site. The site's geolo-
s, vegetation, wildlife, and archaeology are
d by water. The largest of the 3 watersheds
ain the hill is rapidly being urbanized up-
presenting potential flooding and erosion
. These problems may be reduced simply,
ically, and wisely in a land-use plan. The
may be managed to reduce hydrologic
by widening stream channels, installing
eckdams, and vegetating the drainageways.
rocedures would slow runoff velocities, in-
the cross-sectional area of flow and
ess coefficient, and provide more water for
ion and wildlife. The land-use plan should
clude environmental education programs
would present important effects of water on
tural ecology and hydrologic aspects of
ed urbanization. (Robinett-Arizona)

Identifiers: *Arvin-Maricopa area(Calif).

One-half of the entire San Joaquin Valley in California is currently (1972) affected by land subsidence caused by man's exploitation of the natural resources. About 4,300 sq mi have subsided more than 1 foot, and maximum subsidence exceeds 28 feet. The Arvin-Maricopa area is the southernmost of the three principal areas of widespread subsidence in the San Joaquin Valley. As of 1970, 700 sq mi of irrigable land, roughly 60 percent of the area, has subsided due to the intensive pumping of groundwater. Maximum subsidence exceeds 9 feet, and the total volume of subsidence (1926-70) is about 1 million acre-ft. Subsidence results from the compaction of water-yielding deposits as intergranular stresses are increased by water-level declines. Also, scattered local areas are affected by the hydrocompaction of moisture-deficient surficial deposits and by subsidence due to the extraction of oil-field fluids. The subsidence/pumpage ratio is a measure of the proportion of the groundwater pumpage represented by mined 'water-of-compaction.' For 1962-65 this ratio varied from a few percent around the perimeter of the subsidence area to more than 40 percent of the area of maximum subsidence. When contoured, these ratios clearly define areas where surface-water imports would have the most significant effect in alleviating subsidence. (Woodard-USGS)

A GRAPHICAL PROCEDURE FOR CLASSIFYING AQUIFER MANAGEMENT STRATEGY,
Missouri Univ., Columbia. Dept. of Geology.
J. M. Sharp, Jr.
Water Resources Bulletin, Vol 11, No 5, p 1040-1045, October, 1975. 2 fig, 7 ref.

Descriptors: *Aquifer management, *Decision making, *Graphical methods, *Water utilization, *Water source, Groundwater, Aquifers, Administration, Planning, Classification, Water demand, *Arizona.
Identifiers: *Tucson Basin(Ariz).

A graphical procedure is proposed as a visual aid tool for use in aquifer managment decision-making by nonhydrologists. Recent trends significantly affecting management strategy are noted, and a variety of management schemes are considered. The classification method presented demonstrates the importance of water use and source interplay and allows consideration of the time element in aquifer development. The procedure, a modification of Piper's six-variable method that was developed for water chemistry nalaysis, is described and, as an example, applied to groundwater usage in the Tucson Basin (Mills-Arizona)

Identifiers: San Francisco Volcano(Ariz), Flagstaff(Ariz).

The Inner Basin is a collapse and erosional feature in San Francisco Mountain, an extinct volcano of Late Cenozoic age, which lies approximately eight miles north of Flagstaff, Arizona. The main aquifer's coefficient of transmissibility is approximately 14,000 gallons per day per foot and the storage coefficient was 0.08. Aquifer boundaries increased rates of drawdown of water levels in the Inner Basin well field. Inner Basin springs which issue from perched reservoirs are not affected by pumpage of Inner Basin wells. Recharge is greater than the average yield from springs and wells in the Basin which has an average of 8,000 acre-feet of water in storage in the principal aquifer. A large amount of water is lost from the Inner Basin aquifer system via leakage into underlying fractured volcanic rocks. It is believed that a part of this water could be intercepted by pumpage from a well constructed in the Interior Valley. (Robinett-Arizona)

GEOTHERMAL ENERGY SYSTEM AN TROL APPARATUS,
Sperry Rand Corp., New York. (assignee).
H. B. Matthews, and K. E. Nichols.
U.S. Patent No 3,910,050, 11 p, 16 fig, 9 cial Gazette of the United States Patent Vol 939, No 1, p 80, October 7, 1975.

Descriptors: *Patents, *Geothermal *Thermal properties, *Alkaline water, *H

, Electrical power production, Thermal
lants.

vention provides an efficient means for the
ion of electrical power at the earth's sur-
sing energy abstracted from a subterranean
mal source. The apparatus includes means
efficient and reliable generation os super-
steam and a steam driven pumping system
ot water well bottom operated for transfer
hot water to the earth's surface where its
content is transferredto a closed-loop,
urbine-alternator combination for the
ion of electrical power. Cooled, clean
regenerated by the surface-located system
njection into the deep well and the residual,
trated solute-bearing water is pumped back
earth. Reliable operation of the system is
by control arrangements in which the
e of the clean water entering the subter-
steam generator determines the rate of
nass flow through the pump-driving steam
and thus determines the proper pressure of
pumped well water. Thus, by control of the
pressure of the clean water pump at the
surface, the hot pumped well water pres-
accurately determined. This arrangement
rmits starting and stopping of the deep well
g apparatus and allows the adequate lubri-
f the bearings. (Sinha-OEIS)

tors: *Patents, *Geothermal studies,
transfer, *Heat flow, Temperature,
les, Steam turbines, Heat exchangers.
ers: Heat pipe.

ole is drilled into the earth to a depth suffi-
reach strata having geothermal tempera-
f at least 240 deg F. Strata may be liquid,
tc. as long as temperature is at a useful
mal temperature level. A sealed passive
pe is inserted into the well. The heat pipe,
the aid of an active pumping arrangement,
rs the geothermal heat to a steam chamber
ar the surface of the earth. Water injected
steam chamber is converted to steam by
heat pipe, the steam in turn being applied
a steam turbine or other energy conver-
vice. After driving the turbine the steam is
sed to liquid form and pumped back to the
hamber where it is once again converted to
for driving the turbine. The method is
erized by the fact that only heat and not
is removed from the earth, and by the fact
at transfer is accomplished without costly
fficient active pumping apparatus. There-
e method is pollution free and results in no
bsidence. Moreover the efficiency of the
y process is higher than in other forms of
mal energy conversion. (Sinha-OEIS)

AN IMPROVED METHOD OF SILICON-32 MEASUREMENT OF GROUNDWATERS,
Physical Research Lab., Ahmedabad (India).
V. N. Nijampurkar, and B. L. K. Somayajulu.
Proceedings of the Indian Academy of Sciences, Vol 80, No 6, p 289-298, December, 1974. 4 fig, 3 tab, 15 ref.

Descriptors: *Radioactive dating, *Radioactivity techniques, *Tracers, *Phosphorus radiosotopes, *Groundwater movement, Age, Aging(Physical), Radioisotopes, Water chemistry, Groundwater, Trace elements, Water analysis.
Identifiers: *Phosphorus-32, *Silicon-32, Hydrofluorisation, Beta activity.

The usefulness of cosmic ray produced silicon-32 for studying groundwater movements has been realized during the past decade. Two technological development are described in which the chemistry is done more rapidly and efficiently, and the beta activity of phosphorus-32 is assayed with a factor of two better efficiency than the earlier method. A rapid method of separation of P-32 from Si-32 by hydrofluorisation saves considerable time besides being more efficient in the chemical recovery of phosphorus. Similarly, 4 pi beta counting of P-32 activity allows a more accurate estimation of small amounts of this activity. These improvements make it possible to reliably measure amounts of Si-32 as low as 0.1 disintegrations per minute (dpm) present in about 10 tons of water. (Robinett-Arizona)

GROUND-WATER RESOURCES OF LACKAWANNA COUNTY, PENNSYLVANIA,
Susquehanna River Basin Commission, Harrisburg, Pa.; and Pennsylvania State Geological Survey, Harrisburg.
J. R. Hollowell, and H. E. Koester.
Pennsylvania Department of Environmental Resources, Harrisburg Water Resources Report 41, 1975. 106 p, 26 fig, 3 plate, 20 tab, 28 ref.

Descriptors: *Groundwater resources, *Well data, *Water yield, *Aquifer characteristics, *Pennsylvania, Water quality, Water pollution sources, Coal mine wastes, Streams, Chemical analysis, Hydrologic data, Maps.
Identifiers: *Lackawanna County(Pa).

Lackawanna County comprises an area of about 450 sq mi in northeastern Pennsylvania. The county is bisected by the Lakawanna Valley, part of a structural basin containing the Northern Anthracite field. Since 1960, suburban development has created a demand for groundwater supplies. The principal aquifer is the Catskill Formation. Other aquifers are utilized, but, because of their small areal extent, they are relatively unimportant. Groundwater occurs mainly in bedding planes, joints, faults, and other fractures in the rocks. Wells drilled into the fractured rock aquifer have yields that range from a half gallon to 300 gpm. Wells drilled in valleys have a median yield of 50 gpm, which is about 40 times that of hilltop and hillside wells. Water from most wells tapping the Catskill Formation is of good quality. It is low in dissolved solids and is primarily a bicarbonate-type water. Mine drainage enters the Lackawanna River at numerous points along its course in Lackawanna County. Dissolved-solids content of the Lackawanna River ranges from less than 30 mg/litre above Simpson to more than 1600 mg/litre at the mouth.

Identifiers: *Pakistan, *Punjab region(Pakistan).

Around the turn of the century, a network of more than 40,000 miles of canals was constructed to divert water from the Indus River and its tributaries to about 23 million acres of largely unused desert in the Punjab region of Pakistan. The perennial supply of irrigation water made available through the canals instituted the beginning of intensive farming. However, because of generally poor drainage and the high rate of canal leakage, the water table began to rise. By the late 1930's the combined effect of waterlogging and salinity had reduced the agricultural productivity of the region to one of the lowest in the world. In 1954 the Government of Pakistan, in cooperation with the U.S. International Cooperation Administration, undertook a study that resulted in the formulation f a groundwater reclamation program. The principal feature of the program is the utilization of a network of deep wells spaced about a mile apart for the dual purpose of lowering the water table and for providing supplemental irrigation water. Annual water budgets for the first 6 years of project operation indicate that pumping caused a decrease in annual groundwater outflow from about 57,000 acre-ft to 32,000 acre-ft, caused an increase in annual groundwater inflow to the project area from 35,00 acre-ft to 52,000 acre-ft, and depleted about 1.71 million acre-ft of groundwater storage. Pumping has created a circulation system in the groundwater reservoir that will cause a gradual increase in concentration of dissolved solids. Eventually it will become necessary to export or otherwise treat saline water if irrigation is to continue. (Woodard-USGS)

GROUND-WATER RECONNAISSANCE IN THE FRESNO NORTHEAST AREA, FRESNO COUNTY, CALIFORNIA,
Geological Survey, Sacramento, Calif.
R. W. Page.
Open-file report 75-315, October 1975. 34 p, 9 fig, 3 tab, 13 ref.

Descriptors: *Groundwater resources, *Hydrologic data, *Hydrogeology, *Aquifer characteristics, *California, Groundwater movement, Specific yield, Storage capacity, Water level fluctuations, Water wells.
Identifiers: *Fresno County(Calif).

The Fresno northeast area includes about 133 sq mi in the central part of California. Four physiographic units occur in the area, the largest of which is the compound alluvial fan of the intermittent streams north of the Kings River. Geologic units consist of consolidated rocks and unconsolidated deposits. The consolidated rocks yield only small quantities of fresh water to wells. The unconsolidated deposits immediately overlie the consolidated rocks and, within their upper part, yield large quantities of water to wells. Total storage capacity in the upper 200 ft is about 1,100,000 acre-ft. The total volume of groundwater underflow moving out of the area is about 60,000 to 70,000 acre-ft per year. Two water-level contour maps indicate that changes in water use over a 12-year period have not greatly affected the direction of groundwater movement. Most of the storage changes in the reservoir have occurred in the upper 100 ft through a long-term water-level fluctuation of less than 40 ft. In general, water levels rise during winter, level off during spring, and decline from summer through autumn. (Woodard-USGS)

GROUND-WATER RESOURCES OF ORANGEBURG COUNTY, SOUTH CAROLINA,
Geological Survey, Columbia, S.C.
G. E. Siple.
South Carolina State Development Board, Columbia Division of Geology, Bulletin No 36, 1975. 59 p, 10 fig, 7 tab, 53 ref.

Descriptors: *Groundwater resources, *Aquifer characteristics, *Hydrologic data, *Water quality, *South Carolina, Hydrogeology, Water wells, Water yield, Water utilization, Water level fluctuations, Well data, Chemical analysis.
Identifiers: *Orangeburg County(SC).

Groundwater of good quality in relatively large quantities is available throughout most of Orangeburg County, South Carolina. The northwestern part of the county lies within the upper Coastal Plain physiographic province. It is separated from the lower Coastal Plain (Southeastern part) by the Citronelle escarpment. Throughout most of the county the principal aquifers constitute a multiple-artesian system. The major aquifers in the upper Coastal Plain are the quartzose sands in the Orangeburg Group of Eocene age and the coarse sands and gravels of Late Cretaceous age. In the lower Coastal Plain the major aquifers are in the Santee Limestone of Eocene age and the coarse sands and gravels of Early to Late Cretaceous age. The hydraulic conductivity of the Cretaceous sand aquifers is estimated to range from 1,000 to 1,500 gpd/sq ft. Well yields range from 1,200 to 2,000 gpm and specific capacities range from 25 to 50 gpm/ft (gallons per minute per foot of drawdown). The potentiometric head of this aquifer system (Cretaceous sands) has been lowered about 10 feet during the last 8 years in the Orangeburg area. Wells developed in the Santee Limestone yeild up to 700 gpm and have specific capacities ranging from 0.2 to 15 gpm/ft. Water from the Cretaceous aquifers in very soft, low in dissolved solids, has an average pH of 6.3 and a dissolved iron content of 0.7 mg/litre. Water from the Santee Limestone is moderately hard and has a pH of 7.0 or higher. (Woodard-USGS)

A DIGITAL-COMPUTER MODEL FOR ESTIMATING DRAWDOWNS IN THE SANDSTONE AQUIFER IN DANE COUNTY, WISCONSIN,
Wisconsin Geological Survey, Madison.
R. S. McLeod.
Wisconsin Geological and Natural History Survey, Madison, Information Circular Number 28, June 1975. 91 p, 25 fig, 6 tab, 11 ref

Descriptors: *Computer models, *Model studies, *Drawdown, *Aquifers, *Forecasting, *Wisconsin, Digital computers, Computer programs, Aquifer characteristics, Hydrologic properties, Hydrogeology, Sandstones, Projections
Identifiers: *Dane County(Wis)

A digital aquifer program was developed to compute unsteady and steady-state hydrologic changes caused by pumping from a confined aquifer. The program computes head changes in the confined aquifer and the rate and volume of water withdrawn from aquifer boundaries. The program was used to model the sandstone aquifer underlying Dane County, Wisconsin. The aquifer was modeled as a confined aquifer recharged by leakage from the overlying upper aquifer. The physical properties of the aquifer system needed for the model were approximated using aquifer-test data and by matching drawdowns resulting from aquifer development through 1970 with drawdowns computed by the model. The sandstone aquifer should be able to supply the water needs of Dane County well beyond 1990. Maximum regional drawdown of approximately 40 ft (12 m) between 1970 and 1990 were computed by the model. This amount of additional drawdown would not seriously deplete the groundwater supply. (Woodard-USGS)

In: Vol 4: Hydrology and Water Resources in Arizona and the Southwest, Proceedings of the 1974 Meetings of the Arizona Section, American Water Resources Association and the Hydrology Section, Arizona Academy of Science, April 19-20, 1974, Flagstaff, Arizona, p 278-288, 1 fig, 4 tab, 4 ref.

Descriptors: *Water management(Applied), *Range management, *Forest management, *Forest management, *Environmental effects, Water conservation, Forests, Water resources, Lumbering, Livestock, Grazing, Recreation, Wildlife, Land management, Land development, *Arizona.
Identifiers: Canyon Creek(Ariz).

Canyon Creek is an 8,784-acre unit of land located just below the Mogollon Rim on the Tonto National Forest in Arizona. Many of the uses of the area, such as for timber harvesting, livestock uses and recreation, compete among themselves and also with other values such as natural beauty and wildlife. This study attempts to determine in what areas management sould be emphasized to maximize the total use of all resources within Canyon Creek. An analysis was made of the timber aspects, grazing uses, recreation, land sub possibilities, water resources, and the beauty and wildlife conditions. As a result analysis, the following management dire suggested for the area: efforts should be reduce livestock levels, timber harvesting be restricted to salvage sales and small cuts in areas of timber sites with harve straints, development of campgrounds an should be undertaken in certain timbered timber harvesting is not done, the priva should not be subdivided, and stream im ment work should be done in Canyon C companied by livestock control. on by mass wasting processes is often un-
timated because some processes, such as soil
and dry creep, are unspectacular and others,
lides, occur infrequently. Actually, in moun-
us regions, these forms of erosion make up a
proportion of the total erosion. Mass move-
s are especially sensitive to disturbances by
such as road building, logging, and vegetative
pulation. The interactions between road loca-
nd slope stability are discussed. Quantitative estimates of the erosional costs are presented for a brush to grass conversion in southern California. Since existing terrain features indicate the likelihood of slope failure, the erosional cost of activities likely to decrease slope stability can be fairly well appraised in advance. THE HYDROLOGY OF CHAPARRAL WATERSHEDS,
Forest Service, Berkley, Calif. Pacific Southwest Forest and Range Experiment Station.
R. M. Rice.
In: Proc., Symposium on Living with the Chaparral, Riverside, Calif., 1973:27-34, Sierra Club, San Francisco.

Descriptors: *Chaparral, *Forest fire, *Debris avalanches, Wettability, Floods, Mass movements, Sedimentation, Channel erosion, Hydrology budget, Runoff, California.
Identifiers: *Dry ravel, Soil water repellency, Southern California.

The hydrology of southern California chaparral is reviewed. Erosional processes on steep slopes are discussed in considerable detail. Gravity processes of dry ravel and landslides are estimated to account for 80 percent of the erosion on side slopes. Most sediment is carried by high flows which characteristically follow when chaparral is consumed by fire. Most of the sediment in such flows is from remobilized channel alluvial and colluvial deposits. (Forest Service-USDA)

AIRCRAFT AND SATELLITE MONITORING OF WATER QUALITY IN LAKE SUPERIOR NEAR DULUTH,
Wisconsin Univ., Madison. Dept. of Civil and Environmental Engineering.
J. P. Scherz, M. Sydor, and J. F. VanDomelen.
In: Third Earth Resources Technology Satellite-1 Symposium, Volume 1: Technical Presentations, Section B. NASA SP-351, Proceedings of Symposium held December 10-14, 1973, Washington, D.C., p 1619-1636, 1974, 10 fig, 6 ref. NASA NGL 50-002-127, NGL 24-005-263, Army DACW-37-74-C-0014.

Descriptors: *Satellites(Artificial), *Aerial photography, *Remote sensing, *Water quality, *Lake Superior, Turbidity, Suspended solids, Reflectance, Water properties, Analytical techniques, Water supply, Intakes, Lakes, Water pollution, Surveys, Monitoring.
Identifiers: *ERTS, *Duluth(Minn).

Satellite images and low altitude aerial photographs often show vivid discolorations in water bodies. These aerial images are just pretty pictures unless one knows to which water quality parameters the discolorations correlate and how this correlation can be reliably made. Extensive laboratory analysis showed that water reflectance, which causes brightness on aerial images, positively correlates to the water quality parameter of turbidity, which on a particular day correlates to suspended solids. Work with low altitude photography on three overcast days and with ERTS images on five clear days provided positive correlation of image brightness to the high turbidity and solids which are present in Lake Superior near Duluth over 50% of the time. Proper use of aerial images would have shown that an $8,000,000 drinking water intake constructed in the midst of this unpotable, turbid water should have been located 6 miles north in clear, usable water. Noise effects such as skylight reflection, atmospheric effects, and depth penetration also must be understood for operational use of remote sensing for water quality monitoring and were considered. QUANTITATIVE WATER QUALITY WITH ERTS-1,
Geological Survey, Lawrence, Kans.
H. L. Yager, J. R. McCauley, G. W. James, L. M. Magnuson, and G. R. Marzolf
In: Third Earth Resources Technology Satellite-1 Symposium, Volume 1: Technical Presentations, Section B. NASA SP-351, Proceedings of Symposium held December 10-14, 1973, Washington, D.C., p 1637-1651, 1974. 20 fig, 4 ref. NASA NAS5-21822.

Descriptors: *Satellites(Artificial), *Remote sensing, *Water quality, *Kansas, Lakes, Reservoirs, Suspended solids, Turbidity, Chlorophyll, Reflectance, Analysis, Analytical techniques, Sampling, Monitoring, Surface waters, Great Plains.
Identifiers: *ERTS.

Analyses of ERTS-1 MSS computer-compatible tapes of reservoir scenes in Kansas along with ground truth show that MSS bands and band ratios can be used for reliable prediction of suspended loads up to at least 900 ppm. The major reservoirs in Kansas, as well as in other Great Plains states, are playing increasingly important roles in flood control, recreation, agriculture, and urban water supply. Satellite imagery is proving useful for acquiring timely low cost water quality data required for optimum management of these fresh water resources. (See also W76-02026) (Sims-ISWS)

NEW METHOD FOR THE DETERMINATION OF THE TOTAL BOD CONTENT OF WASTE-WATERS (NOVYY METOD OPREDELE BPK-POLNOGO STOCHNYKH VOD),
Y. Y. Lur'e, and V. A. Odaryuk.
Vodosnabzhenie i Sanitarnaya Tekhnika N 28-29, 1975, 4 ref

Descriptors: *Biochemical oxygen de *Analytical techniques, *Pollutant identific Hydrogen ion concentration, Chemical oxyg mand, Organic matter, Inhibitors.
Identifiers: *Ethylene thiourea, Nitrificati hibitors, Reagents.

A method for the determination of the total content of waste waters is described. The m is based upon the addition of ethylene thiou nitrification inhibitor, in a concentration mg/liter, the other reagents are monobasic po um phosphate, dibasic sodium phosphate, ca chloride, ammonium chloride, magnesium su ferrous sulfate, and zinc sulfate. Static or air ing variants of the method are possible. Th value is between 6.5 and 7.5. The method plicable to any waste water, and dilution is sary only at organic matter contents over mg/liter based on the COD value. The requirement for the BOD determination reduced by 2 to 10 times as compared wi dilution method. (Takacs-FIRL)

CERTAIN PROBLEMS OF SUBSTANTIATING PERMISSIBLE DENSITIES OF SURFACE CONTAMINATION WITH BERYLLIUM, (IN RUSSIAN),
Ministerstvo Zdravookraneniya SSSR, Leningrad. Inst. of Biophysics.
G. F. Kovygin.
Gig Sanit, 2, p 43-45, 1974. English summary.

Descriptors: *Beryllium, Water pollution sources, *Surfaces, *Aerosols, Density, *Air pollution, Air circulation, Wastes.
Identifiers: *Redispersion index.

The standardization of the permissible density of surface contamination is discussed. Its coefficient, which is the ratio of the aerosol concentation to the density of surface contamination, can be used as a redisperions index. Between the density of the surface contamination and the redispersion coefficient there exists an inverse correlation ratio, which diminishes with increases in air movement. The equation obtained makes it possible to calculate the theoretical density of surface contamination, the redispersion of which will not cause formation of aerosol concentrations exceding the maximum permissible concentration of Be aerosols.--Copyright 1975, Biological Abstracts, Inc.

UPTAKE OF MERCURY BY FRESHWATER CLAMS (FAMILY UNIONIDAE),
Manitoba Univ., Winnipeg. Dept. of Zoology.
A. L. Smith, R. H. Green, and A. Lutz.
Journal of the Fisheries Research Board of Canada, Vol 32, No 8, p 1297-1303, August 1975, 2 fig, 3 tab, 21 ref.

Descriptors: *Heavy metals, *Mercury, *Toxicity, *Clams, *Mollusks, Lakes, Sediments, Sampling, Path of pollutants, Animal physiology, Analytical techniques, Absorption, Pollutant identification.
Identifiers: Bioaccumulation, Tissue analysis, Anodonta grandis, Lampsilis radiata, Lasmigona complanata, Methylmercuric chloride, Phenylmercuric acetate, Mercuric chloride.

Mercury concentrations were measured in water, sediments, and three species of clams from lakes with and without reported mercury contamination. Elevated mercury levels in clams were associated with elevated mercury levels in water and sediments. Uncontaminated clams were exposed to three mercury compounds at 1.0, 10.50, and 100 micrograms Hg/liter for up to 3 weeks in the laboratory. The clams concentrated the metal in the order methylmercuric chloride >phenylmercuric acetate> mercuric chloride. The rate of uptake of mercury increased with increasing mercury concentration in the water. In most cases, temperature had no effect on the rate of mercury uptake or elimination. The distribution among organs depended on the compound to which the clams had been exposed. Only methylmercuric chloride was concentrated extensively in foot muscle. Transfer of methylmercuric chloride among organs apparently continued after exposure to the compound had ended. (Klein)

REMOTE SENSING OF WATER QUALITY IN PRAIRIE LAKES,
South Dakota State Univ., Brookings. Dept. of Botany and Biology.
D. Moore, and L. Haertel.
Available from the National Technical Information Service, Springfield, Va 22161 as PB-248 040, $4.50 in paper copy, $2.25 in microfiche. South Dakota Water Resources Institute, Brookings, Completion Report, September 1975. 61 p, 6 fig, 35 tab, 38 ref, append. OWRT B-039-SDAK(1). 14-31-0001-5114.

Descriptors: *Remote sensing, Water quality, Lakes, Photography, Aerial photography, *South Dakota, *Pollutant identification, Forecasting, Algae, Nutrients, Nitrates, Chlorophyll, Nitrogen, Phosphorus, Correlation analysis.
Identifiers: LANDSAT-1, *Prairie lakes.

The possibility of predicting prairie lake water quality using remote-sensing data during the 1974 open water season was investigated with four lakes in northeastern South Dakota. Water quality samples were collected to coincide with satellite (LANDSAT-1) overoverpasses and low-altitude aircraft flights. Twelve different remote-sensing estimates were taken from LANDSAT-1 imagery,

low-altitude aircraft photographs, ground-based radiometer readings, and ground-level photographs. These were correlated with prairie lake water transparency (secchi depth) and algae abundance (chlorophyll 'a' and total cell concentrations). Correlations between the three water quality parameters and physical factors (rainfall, solar energy, wind velocity, water temperature, and water depth) and nutrient levels (nitrogen and phoshorus) were also determined. Decreased water depth was associated with higher nutrient levels, increased total algae and chlorophyll 'a', and decreased water transparency. Nitrate appeared to be the principal nutrient positively correlated with algal abundance. Extensive ground-level photographic or radiometric measurements are impractical in many operational programs since the time involved on the ground would justify collection of actual water samples. Low-altitude aerial photographs offer finer resolution of small areas but are more expensive to obtain than satellite data. LANDSAT-imagery offers practical potential for measuring prairie lake water quality. It provides frequent and total coverage of a region at an inexpensive cost. (Wiersma-South Dakota State)

WATER QUALITY MONITORING AND RIVER BASIN PLANNING: A CRITIQUE AND SOME RECOMMENDATIONS,
Rutgers-The State Univ., New Brunswick, N.J. Div. of Urban Studies.
M. R. Greenberg, R. M. Hordon, L. Zobler, and G. W. Carey.
Journal of Environmental Management, Vol 2, No 4, p 319-330, 1974. 8 ref.

Descriptors: *Planning, *Data collections, *New Jersey, Monitoring, Water pollution control, Sampling, Data storage and retrieval, Regulation.

The validity of water related policies based on sophisticated system designs, which in turn, are based on erratic data collection and inconsistent sampling, is faulted. The water monitoring system in the densely developed portion of northeastern New Jersey is evaluated and recommendations are suggested for its improvement. For example, the data represent too few parameters and show a bias toward indices related to human wastes; groundwater, estuarine, and effluent data is completely inadequate. There is a lack of information on nonpoint water pollution sources, sewage effluent data, and industrial discharges. Sampling sites are chosen only on the degree of accessibility. Sampling frequency varies from 15-minute automatic monitors, to three to four times a year at effluent sources, to once to every two years in wells, all at random intervals. Manual monitoring results are inconsistent between and within some agencies in laboratory precedures, in sampling frequency, and the break-up of data sets when new techniques are introduced. Automatic monitors frequently malfunction. Data recording on field sheets and in files differed widely reflecting the special interest of the collecting agency, random choice, and indifference. Data bookkeeping and formal arrangement for machine processing present analytical difficulties. (Auen-Wisconsin)

APPLICATION OF REMOTE SENSING FOR PREDICTION AND DETECTION OF THERMAL POLLUTION,
Miami Univ., Coral Gables, Fla. Inst. of Clean Energy Research.
T. N. Veziroglu, and S. S. Lee.
Available from the National Technical Information Service, Springfield, Va 22161 as N75-10572, $5.00 in paper copy, $2.25 in microfiche. NASA Report CR-139182, October 1974. 95 p, 33 fig, 11 tab, 34 ref. NASA NAS10-8498.

Descriptors: *Remote sensing, *Thermal pollution, *Florida, Model studies, Mathematical models, On-site investigations, Water temperature, Powerplants, Thermal powerplants, Pollutants, Water pollution, *Path of pollutants, Satellites(Artificial), Aircraft, Measurement, Bays, Estuaries, Forecasting.
Identifiers: *Biscayne Bay(Fla).

Proper management of thermal pollution will be based on the ability to detect thermal pollution and to alleviate it. In order to obtain a clear description of the physical situation, an accurate prediction of the water body temperature distribution is needed. This study has several objectives: (1) the development and testing of a generalized mathematical model to predict three-dimensional temperature distribution in coastal regions receiving hot discharges, (2) the improvement in the accuracy of the thermal remote sensing by directly relating it to thermal radiation from the sea surface and by better accounting for the absorption in the atmosphere, and (3) the development and testing of an active remote sensing system to measure the water turbidity. In the model development, a rigid-lid model has been developed and results have been obtained for different wind conditions. The next step is to include tidal effects. Biscayne Bay in south Florida, the site of two Florida Power Plant facilities, is being used for model testing. In the experiment part, the design of the measurement system has been completed. A preliminary research flight of this system on an aircraft, in cooperation with satellite thermal I.R. radiometer and ground truth data collection by boat, was carried out. (Sims-ISWS)

s of radioactivity in excess of natural decay
observed in aqueous samples of P32-P04(---)
C14-CO3(--) counted by liquid scintillation in a
anebase counting solution. Loss of P32-PO4(--
ctivity was increased by the presence of the
03(-) ion and ranged up to 23% in 8 hr and 46%
days. Common solubilizing agents were ineff-
ive in preventing P32-P04(---) loss and only
ially effective in preventing C14-C03(--) loss.
P32-P04(---) activity was recovered by shaking
recounting the sample, but C14-C02(--) activi-
as incompletely recovered. Settling of insolu-
materials within the counting solution ap-
ntly was responsible for P32-P04(---) activity
. A dual mechanism of precipitation of C14-
(--) and volatilization of C14-C02 was responsi-
for C14 loss. Acidification of the counting solu-
prevented P32-P04(---) activity loss; addition
phenethylamine to the counting solution
vented volatilization of C14-C02, but no treat-
t was found to prohibit C14-C03(--) precipita-
. (Henley-ISWS)

dies, Mathematical models, Weather patterns, Precipitation(Atmospheric), Temperature, Air temperature, Radiation, Albedo, Meteorology, Climatology, Air pollution, South America, North America.

The 1973 Rand version of the Mintz-Arakawa model of the general circulation of the atmosphere was used to study the consequences of high concentrations of hygroscopic aersols in a limited geographic region. The experiment was designed to investigate effects of the activity of the aerosol as condensation nuclei, and the consequent abnormal production of cloudiness and alteration of precipitation were of primary concern. Values of meteorological parameters generated by the experiment were compared with values simulated by a control (in which the polluted area was absent). Statistical tests of significance were performed in order to judge the certainty that experimental changes, rather than random wandering of the simulations, actually caused changes in certain variables. Cloudiness increased over the polluted area and the temperature at the surface and in the lower atmosphere became warmer. Rainfall, however, was not significantly altered in the polluted region in spite of changes in the parameterization of the rain that would make rainfall more difficult with a given atmospheric structure. The data suggested a possible connection between North American pollution and South American rainfall. Comparison of data from the experiment and the control indicated that in the experiment, rainfall decreases gradually and steadily within a large area of South America centered on the equator. The immediate cause was the movement of the region of maximum moisture convergence northward, toward, the polluted area, while it is at the same time decreasing in value. (Sims-ISWS)

DETERMINATION OF DISSOLVED GASES IN WATER BY DIFFUSION AND GAS CHROMATOGRAPHIC TECHNIQUES,
Southeast Environmental Research Lab., Athens, Ga.
H. P. Kollig, J. W. Falco, and F. E. Stancil, Jr.
Environmental Science and Technology, Vol 9, No 10, p 957-960, October 1975. 5 fig, 1 tab, 12 ref.

Descriptors: *Pollutant identification, *Gases, *Diffusion, *Water analysis, *Gas chromatography, *Analytical techniques, Instrumentation, Dissolved oxygen, Carbon dioxide, Helium, Nitrogen, Oxygen, Physical properties, Water properties, Chemical analysis, Membranes, Chemistry, Laboratory tests, Aquatic environment, Turbulence.
Identifiers: *Dissolved gases, Plastic membranes, Helium ionization detector, Membrane diffusion, Aqueous systems, Gaseous diffusion, Probe calibration, Gas probes.

A method has been developed for the determination of dissolved oxygen, nitrogen, and carbon dioxide in water. The gases diffuse from the water through a plastic membrane. A stream of helium gas carries the diffused gases to a dual-column gas chromatographic trace gas analyzer equipped with Helium Ionization Detectors. Calibration of the gas probes is performed in a water bath through which analyzed air containing a predetermined amount of carbon dioxide has been bubbled. The system is estimated to have a sensitivity of 5-10 microgram/l of dissolved gas in water. (Henley-ISWS)

Identifiers: *Oak Creek(Ariz), *Rhithron zone, *Potamon zone, Current velocity, Diversity.

The study recorded a total of 41 diatom species, 13 of which were previously unreported for Arizona, with quantitative and qualitative changes in populations measured between rhithron and potamon zones (rhithron communities typically have lower temperatures, higher dissolved oxygen and faster current velocities than potamon communities in addition to typically having an epilithic flora with little or no plankton). There was a distinct change from an epilithic cold water flora in the rhithron zone to an epiphytic warm water flora in the potamon zone, and a decrease in diatom diversity was noted between the rhithron and the potamon zone; thirty-four species were collected at rhithron stations at temperautres below 11C, whereas only 20 species were collected at stations with temperatures above this value. Colonization rates in the rhithron zone were greatest at slower current velocities for short incubation periods. Nitzschia palea and Gomphonema parvulum were very common in various regions of the stream bed suggesting nutrient-rich conditions. (Robinett-Arizona)

Identifiers: Viehl BOD dilution method.

Using Viehl's BOD dilution process in serial testing, oxygen losses (often caused by high oxygen supersaturation of the diluting water) can be avoided by reducing oxygen contents to 20 mg/liter. The method is considerably simplified by use of a nitrification inhibitor and a special BOD flask. In the analysis, errors from the dilution effect can be avoided if only oxygen consumptions between 30% and 70% of the original oxygen contents are used for calculating the BOD. (Ward-IPC)

DETERMINATION OF SEVEN TRACE ELEMENTS IN NATURAL WATERS AFTER SEPARATION BY SOLVENT EXTRACTION

AND ANION- EXCHANGE CHROMATOGRAPHY,
Vienna Univ. (Austria).
J. Korkisch, and A. Sorio.
Analytica Chimica Acta, Vol 79, p 207-218, October 1975, 7 ref, 7 tab.

Descriptors: *Trace elements, *Chromatography, *Water analysis, Anion exchange, Analytical techniques, Separation techniques, Cadmium, Cobalt, Copper, Manganese, Lead, Zinc, Metals, Ion exchange, Spectrophotometry, Fluorometry, Chemical analysis, Water pollution sources, *Pollutant identification, Pollutants, Snow, Sea water.
Identifiers: Uranium, Dowex 1-X8 resin, Adriatic Sea.

A method is described for the determination of cadmium, cobalt, copper, manganese, lead, uranium, and zinc in samples of natural waters. After acidification with HCl the water sample is filtered and the diethyldithiocarbamates of the trace elements are isolated by extraction with acetone-chloroform (2:5) at pH 5. Following this preconcentration step the metal ions are adsorbed on a column of Dowex 1-X8 (chloride form) using as sorption solution a mixture (5:4:1) of tetrahydrofuran, methyl glycol, and 6 molar HCl. Successive elution is effected with 6 molar HCl (Co, Cu, Mn, and Pb), 1 molar HCl (U), and 2 molar nitric acid (Cd and Zn); the metal ions in the eluates are determined by atomic absorption spectrophotometry (except uranium, which is determined fluorimetrically). The procedure was used to determine trace metals in water and snow samples collected in Austria and to analyze a sample of water from the Adriatic Sea. (Witt-IPC)

DECOMPOSITION AND DISAPPEARANCE OF ORGANIC DEBRIS IN THREE REPLICATE STREAMS WITH DIFFERENT NITRATE INPUT,
Oregon State Univ., Corvallis. Dept. of Fisheries and Wildlife.
F. J. Triska, and J. R. Sedell.
Available from the National Technical Information Service, Springfield, Va 22161 as PB-247 574, $4.00 in paper copy, $2.25 in microfiche. Oregon Water Resources Research Institute, Corvallis, Report WRRI-37, October 1975. 45 p, 4 fig, 26 tab, 24 ref. OWRT A-029-ORE(1).

Descriptors: Nitrates, *Decomposing organic matter, Respiration, Organic matter, Streams, Nitrogen, Degradation(Decomposition), Carbon, Leaves, Nutrients.
Identifiers: *Nitrogen concentration, Microbial processing, *Organic debris.

The immobilization and mineralization of nitrogen and phosphorus, the complexing of nitrogen with lignin residues, and changes in the cation exchange capacity in aquatic detritus mimic similar processes of humus formation on land. The role of this debris as surface for microbial colonization, as a prelude to stripping by invertebrates which feed on fine particles, may well be different if the organic particle is incapable of providing a source of energy and nutrients to surface microflora. The quality of such particles should be investigated, as it is exported through successive biological communities. Investigations over the past two years have indicated a capacity for litter and other organic debris to accumulate concentrations of certain elements in relation to decomposition. Rapidly decomposed debris, such as litter, both retains and accumulates nitrogen in the process of decomposition which may be necessary to maintain decomposition rates, and provide sources of essential nutrients for the biotic community. Refractory debris, such as needles and possibly bark and woody debris, also appear to accumulate cations at sometime during decomposition. The understanding of how such organic debris may influence water quality is necessary to properly interpret such data, especially data from small watershed streams where organic debris constitutes a major carbon and nutrient sink.

ESTIFATION OF VERTICAL MIXING IN DISPERSION OF POLLUTANTS IN LAKE E,
eland State Univ., Cleveland, Ohio. Dept. of nical Engineering.
. Galloway, Jr.
ilable from the National Technical Informa- Service, Springfield, Va 22161 as PB-247 707, 00 in paper copy, $2.25 in microfiche. Comple- Report, September 1975, 315 p. OWRT A-036-O(1).

Descriptors: *Computer models, *Diffusion, *Convection, Mixing, Circulation, Dispersion, Dye release, Lakes, Diffusivity, *Lake Erie, Lake Ontario, Model studies, *Path of pollutants, Water pollution sources.
Identifiers: *Dispersion models, Eddy diffusivity, Rhodamine dye.

A computer dispersion model involving horizontal convection and vertical diffusion was developed to establish criteria for vertical averaging, resulting in greater efficiency of computer solution. Different combinations of vertical profiles of velocity and diffusivity were used. Effective horizontal dispersion coefficients (Ke), for use after vertical averaging, were computed from the results of the model problem and also from a formula given by Csanady. The time to reach the condition for vertical averaging correlated as ti = h2/(d1Dz), while Ke = (C1h2U2)/Dz, where h was depth, Dz was average vertical diffusivity, U was a characteristic velocity and d1 and C1 depended on profiles used. Dye release studies were conducted in Lake Erie near Cleveland under various conditions. The data obtained were not able to shed much light on how Dz varied with depth under essentially isothermal conditions. More experiments of longer duration were required. NUMERICAL SOLUTION TO A TWO-DIMENSIONAL DISPERSION EQUATION,
Cleveland State Univ., Cleveland, Ohio. Dept. of Chemical Engineering.
R. Natarajan.
Master of Science Thesis, August, 1973, 128 p, 43 fig, 9 tab.

Descriptors: *Great Lakes, Dispersion, *Diffusivity, *Path of pollutants, *Lake Erie, Lakes, Model studies, Equations, *Mathematical models, *Distribution patterns, Forecasting, *Diffusion.
Identifiers: Vertical distribution, *Vertical eddy diffusivity.

Many types of dispersion models are being developed to predict the pollutant concentration in the Great Lakes. A two-dimensional form of the general transport equation is numerically solved to obtain the concentration distribution resulting from an initial narrow Gaussian input. Results were obtained for two different velocity profiles and three different di mensionless values of vertical eddy diffusivity (Dz). For a given profile, there is significant vertical variation in concentration as long as the effective horizontal dispersion co-efficient Dx* is increasing. When Dx* reaches a constant value, there is very little vertical variation. The predicted time and space scales for significant vertical variation of concentration appear to correlate well with the computed dispersion examples in the western basin of Lake Erie. The method appears to be generally suitable for determining a priori when vertical variation must be considered in a particular dispersion modeling effort. Since the results are quite sensitive to the Dz values, it appears that Dz should be fairly well defined in order to get accurate prediction of concentration. This necessitates a thorough investigation into the Dz variation in the Great Lakes. (See also W76-02152)
W76-02153

CRITERIA FOR THE USE OF VERTICAL AVERAGING IN GREAT LAKES DISPERSION MODELS,
Cleveland State Univ., Cleveland, Ohio. Dept. of Chemical Engineering.
S. Vakil.
MS Thesis, June 1975. 99 p, 34 fig, 9 tab, 13 ref, 3 append.

Descriptors: *Computer models, Model studies, Lakes, *Dispersion, Velocity, Diffusivity, *Diffusion, *Path of pollutants.
Identifiers: *Vertical diffusivity, Two-dimensional models, Three-dimensional models.

A model problem involving horizontal convection and vertical diffusion is solved on the computer to establish criteria to choose between two and three dimensional models for large lakes. Different combinations of vertical profiles of velocity and diffusivity were used. The arrival of the horizontal direction variance of the concentration distribution to a linear time dependence was found to be a suitable criterion for the use of vertical averaging. Effective horizontal dispersion coefficients (Ke) for use after vertical averaging were computed from the results of the model problem and also from a formula given by Csanady. Both methods gave good agreement of the values of Ke. The method and results presented have wide application in dispersion modeling for large lakes pertaining to the choice of a two or three dimensional model and an effective horizontal dispersion coefficient for the vertically averaged cases. W. F. Horak, and G. S. Lehman.
In: Vol 4: Hydrology and Water Resources in Arizona and the Southwest, Proceedings of the 1974 Meetings of the Arizona Section, American Water Resources Association and the Hydrology Section, Arizona Academy of Science, April 19-20, 1974, Flagstaff, Arizona, p 137-143. 4 fig, 4 ref.

Descriptors: *Water quality, *Coliforms, *Streptococcus, *Lakes, *Arizona, Aquatic bacteria, Water quality standards, Water pollution, Farm wastes, Swimming, Aquatic microbiology, Public health, Salmonella, Water analysis, Water pollution sources, Water quality control, Bottom sediments.

Fecal coliform counts in relation to number of swimmers along with fecal streptococci counts of water samples from Canyon Lake in central Arizona are reported. The presence of swimmers was related to an increase in fecal coliforms which was attributed to organisms shed from the swimmers and from agitation of the bottom sediments, consequently dispersing much of the bacteria contained in the benthos. From sampling of the swimming areas it was determined that livestock waste was the primary source of pollution (a greater number of fecal streptococci was found than fecal coliforms), but this interpretation could be misleading due to the higher survival rate of fecal strep than that of fecal coliform organisms. LIBRARY U. OF I. URBANA-CHAMPAIGN

TIME-RELATED CHANGES IN WATER QUALITY OF STOCK TANKS OF SOUTHEASTERN ARIZONA,
Agricultural Research Service, Tucson, Ariz. Southwest Watershed Research Center.
D. E. Wallace, and H. A. Schreiber.
In: Vol 4: Hydrology and Water Resources in Arizona and the Southwest, Proceedings of the 1974 Meetings of the Arizona Section, American Water Resources Association and the Hydrology Section, Arizona Academy of Science, April 19-20, 1974, Flagstaff, Arizona, p 144-157. 8 fig, 1 tab, 3 ref.

Descriptors: *Stock water, *Ponds, *Algae, *Water chemistry, *Regression analysis, *Water quality, Farm ponds, Water harvesting, Standing waters, Water storage, Nutrients, Hydrogen ion concentration, Inorganic compounds, Water analysis, Variability, Time, Nitrogen compounds, Potassium, Inflow, Bicarbonates, *Arizona.
Identifiers: Algal growth, Stock tanks, Stepwise linear regression.

This study attempts to determine the water quality changes in stock tanks and what factors are instrumental in the changes, and to assess the effects of the changes. Algal growth was the most prominent change taking place in the tanks with time. Little change in the water chemistry was noted until just before the tanks dried up. As algae died, ions tied up by the algae were released to the water, causing an increase in concentration of many of the nutrients. In order to determine the impact of various factors on algal growth, the data from eight stock tanks were analyzed by stepwise linear regression. Although 20 variables were used in the complete analysis, six variables were associated with 56.3 percent of the variance: time (since first sampling), total N, potassium, pH, Inflow (recharge to the tanks), and HCO3 concentration. Time and total N explained 51.3 percent of the variance, and potassium increased the variance to 52.8 percent. The pH reversed the relative positions of time and total N, with total N becoming dominant. The last two factors, Inflow and HCO3 were negative (resulting in a decrease in algal population) and incrased the coefficient of variance to 56.3 percent. (Robinett-Arizona)

Identifiers: Parker Strip.

The Parker Strip is a 14.6 mile river stretch on the Lower Colorado River bounded by Parker and Headgate Rock Dam. This river reach has recently become a high use recreation area with 4,000 permanent residents and up to 120,000 visitors on long weekends. Sewage disposal is exclusively via septic tanks, and recent surveys have localized surface water bacteria levels that may indicate a developing groundwater problem. The deposits in which the septic tanks are located are quite thin and narrow and consist of locally derived sands and gravels which indicate a relatively short flow time for the river. Chemical analysis of groundwater wells has shown high levels of fluoride, chloride, sulfate and total dissolved solids, of which some have been found at levels higher than the U.S. Public Health Drinking Water Standards. Intensive evaluation of the degradation of the water quality in the groundwater of the Parker Strip area is needed to determine whether the groundwater is jeopardized by septic tank systems. (Robinett-Arizona)

EVALUATION OF MATHEMATICAL MODELS FOR TEMPERATURE PREDICTION IN DEEP RESERVOIRS,
Vanderbilt Univ., Nashville, Tenn.
F. L. Parker, B. A. Benedict, and C. Tsai.
Available from the National Technical Information Service, Springfield, Va 22161. Environmental Protection Agency, Report EPA-660/3-75-038, June 1975. 205 p, 201 fig, 23 tab, 19 ref. 1BA032. R-800613.

Descriptors: *Thermal pollution, Reservoirs, *Mathematical models, Lakes, Tennessee Valley Authority, Model studies, Evaluation, *Forecasting.
Identifiers: *Deep reservoir models, Sensitivity analysis.

The deep reservoir model with one-dimensional assumptions can be applied to a reservoir or lake where the principal variation of flow characteristics is in the vertical direction. Among the models evaluated, the MIT deep reservoir model appears to be most easily used and to give results most compatible with the measured temperatures. The temperatures predicted is strongly dependent upon the magnitude of the absorption coefficient of water, and the diffusion coefficient. However, sensitivity analysis shows that an absorption coefficient of about 0.75m-1 and a diffusion coefficient of 15 to 20 times molecular diffusion are appropriate choices for the seven TVA reservoirs studied. The determination of whether or not a reservoir or lake is suitable for the application of a deep reservoir model depends on the Densimetric Froude number. However, the representativeness of the results is not soley dependent upon the Densimetric Froude number. By the use of a fitted curve to the measured temperatures, it was possible to determine the maximum standard error of estimate for the predicted outlet level temperature, 1.6C. Temperatures on individual days may exceed these values and they surely are exceeded at other depths in the reservoir. These limits are suggested as the limit of accuracy of these types of models. (EPA)

IMPROVING THE STATISTICAL RELIABILITY OF STREAM HEAT ASSIMILATION PREDICTION,
R. W. McLay, M. S. Hundal, and K. P. Lamborn.
Available from the National Technical Information Service, Springfield, Va 22161. Environmental Protection Agency, Report EPA-660/3-75-037, June 1975. 157 p, 5 fig, 3 tab, 8 ref, 4 append. EPA 1BA032. 68-03-0439.

Descriptors: *Forecasting, Reliability, *Water temperature, Estimating, *Statistical methods, Thermal pollution, Probability, Model studies, Weather data.
Identifiers: *Heat assimilation prediction, Stream temperature prediction, Sensitivity analysis.

An evaluation is presented of existing, one-dimensional stream temperature prediction techniques for accuracy and precision. A sensitivity analysis of a general model is used in conjunction with statistical methods to determine solution errors. Data taken in 1973 at the Vernon, Vermont nuclear plant are used as a data base. These data are used with Burlington, Vermont airport weather station data to (1) gain insight into the orders-of-magnitude of the various errors and (2) carry out a detailed data analysis to establish probabilit meeting given error requirements. Descriptors: *Water chemistry, *Nutr *Phenols, *Wood wastes, *Lodgepole pine *Clear-cutting, Chemical properties, Nit Phosphorus, Magnesium, Calcium, Pota Sodium, Organic compounds, Water poll Wyoming, Leaching, Soil water, Burning.

Clearcutting and four different methods of lo residue disposal did not substantially increase centrations of sodium, potassium, calcium, nesium, nitrate nitrogen and phosphorus i waters under lodgepole pine stands northwestern Wyoming. Slight increases of elements were observed following broadcast ing due to conversion of the elements to a soluble form. However, when residues chipped and spread over the logged areas, phenol levels increased roughly 60-fold to 650 ppb in the first post-treatment year. Less creases in phenols occurred where chips removed perhaps due to incorporation of fin ganic material during the logging oper (Forest Service-USDA)

HLORIDE IN NATURAL WATERS OF NEW AMPSHIRE,
ew Hampshire Univ., Durham. Inst. of Natural d Environmental Resources.
R. Hall.
vailable from the National Technical Informaon Service, Springfield, Va 22161 as PB-248 060, .00 in paper copy, $2.25 in microfiche. New ampshire Agricultural Experiment Station, Durm, Station Bulletin 504, June 1975. 25 p, 9 fig, 3 b. OWRT A-027-NH(1). 14-31-0001-3529.

escriptors: *Chlorides, Water quality, Water poltion sources, *New Hampshire, *Path of pollunts, *Indicators, Tracers, Salts, *Deicers, Corsion, Groundwater, *Pollutant identification.
entifiers: *Road deicing salts.

hloride is a mobile, chemically inactive conituent in natural waters, and for this reason it seful as a tracer or indicator of pollution. Chloride is not harmful to humans except at fairly high concentration; however, associated elements may be harmful at fairly low concentrations. Normal background values must be determined before the effects of human activity can be assessed. Likely natural sources include atmospheric precipitation, dry fallout, rock weathering, and saline water. The major sources arising from human activities can be grouped into the categories of sewage and septic tank effluents, industrial effluents, and road deicing salt. Chloride balances for 1920 and 1970 and scatter diagrams for selected water supplied for 1918-1970 indicate that in New Hampshire chloride increased. This does not seem serious on a statewide basis, but definite problems arise at more local levels due both to direct and indirect effects. Automobile body corrosion, vegetational kills, and damage to concrete have long been known to arise from use of road deicing salt, but there are many other possible difficulties as well. Small ground water reservoirs may not be greatly harmed in the long run by road deicing salt, whereas larger aquifers may undergo long term degradation. Problems are likely to arise in receiving waters such as stream, wetlands, and ponds whether or not ground water quality is seriously impaired. Heavy metals accompnaying chloride or arising from corrosion of home water systems may pose health problems in addition to the better known problems presented by sodium.

SANITARY CHARACTERIZATION OF THE SARATOV RESERVOIR IN THE REGION OF AN OIL REFINERY, (IN RUSSIAN),
Kuybyshevskii Inshonere-Stroitelayi Institut (USSR).
E. D. Starodubtsev.
Gig Sanit, 7, p 113-114, 1974.

Descriptors: *Oil wastes, Industrial wastes, Oil pollution, Water pollution sources, *Biological treatment, Waste water treatment, Water quality, *Sewage treatment, Rivers, Reservoirs.
Identifiers: Saratov reservoir, *USSR(Volga River).

The wastewaters of the oil refinery consist of 20% domestic raw sewage and 80% industrial sewage. The total amount of wastes is 1500-1700 m3/h, discharged directly into the Saratov reservoir on the Volga River (USSR). The hydraulic regime of the flow and water quality were investigated in the wastewater discharge area, without biological treatment (1970), and after construction and operation of biological treatment plants (1971-1972). The overall pollution of the reservoir has decreased significantly.--Copyright 1975, Biological Abstracts, Inc.

HYGIENIC PROBLEMS OF THE DESIGN, CONSTRUCTION AND OPERATION OF GROUP WATER SUPPLY SYSTEMS, (IN RUSSIAN),
Nauchno-Issledovatelskii Institut Selskoi Gigieny, Saratov (USSR).

A. M. Akimov, V. B. Aksenova, V. P. Rassolova, G. I. Rozhnov, and E. A. Dik.
Gig Sanit. 7 p 98-100, 1974.

Descriptors: *Water supply, *Water pollution sources, Design, Construction, Rivers, *Organic wastes, Water quality, Operation.
Identifiers: Ishim River, Kazakh-SSR. *USSR.

Water quality was studied in 1967-1972 in 2 major water-supply lines of the northern Kazakh SSR, USSR, the Ishim and Bulaevo, and in their source, the Ishim River. The Ishim River is subjected to constant and increasing pollution, primarily of an organic character. A main cause of this is the absence of organized zones for sanitary protection of water intakes of the group water-supply lines, due to shortcomings in their design and construction. The design, construction and operation of the group water supply systems should be completely changed.--Copyright 1975, Biological Abstracts, Inc.

EVALUATION OF GROUND-WATER DEGRADATION RESULTING FROM WASTE DISPOSAL TO ALLUVIUM NEAR BARSTOW, CALIFORNIA,
Geological Survey, Garden Grove, Calif.
J. L. Hughes.
Available from Supt. of Documents, GPO Wash., D.C. 20402, Price $1.20. Professional Paper 878, 1975, 33 p, 13 fig, 8 tab, 29 ref.

Descriptors: *Water pollution, Groundwater, *Waste disposal, *Aquifers, *California, Water quality, Data collections, Chemical analysis, Chemical properties, Biological properties, Industrial wastes, Municipal wastes, Sewage, Groundwater movement, Seepage, Water pollution effects.
Identifiers: *Groundwater degradation, *Barstow area(Calif).

Part of the alluvial aquifer along the Mojave River near Barstow, Calif., has been subjected to pollution from percolation of industrial wastes and municipal sewage for nearly 60 years. Effluent discharges have contained high concentrations of detergents, nitrogen, chromium, oil and grease, phosphates, phenols, and other organic and inorganic chemical substances. The poor quality groundwater resulting from the discharge of these wastes has forced abandonment of several domestic wells because of taste, odor, and foaming and is endangering a well field serving the U.S. Marine Corps Supply Center at Nebo. The nature and occurrence of the degraded groundwater, which is moving in very permeable river-channel deposits at an estimated rate of 1.0-1.5 ft (30-45 cm) per day, is described and outlined both areally and vertically. The concentration of dissolved solids, detergents, dissolved organic carbon, total nitrogen, and chloride were studied in three dimensions. (Woodard-USGS)

EVALUATION OF MONITORING OF RADIOACTIVE SOLID-WASTE BURIAL SITES AT LOS ALAMOS, NEW MEXICO,
Geological Survey, Albuquerque, N. Mex.
T. E. Kelly.
Open-file report 75-406, August 1975. 82 p, 11 fig, 1 tab, 19 ref.

Descriptors: *Nuclear wastes, *Radioactive waste disposal, *Solid wastes, *Reviews, *New Mexico, *Monitoring, Evaluation, Waste dumps.
Identifiers: *Los Alamos(N Mex), *Radioactive solid-waste burial.

Burial of solid radioactive waste began at Los Alamos, N. Mex. in 1943. Most of this waste contained a low level of radioactivity; consequently, only limited monitoring of the hydrogeologic environment has been done in the past. This study was based on a file-and-literature search in order to determine the effectiveness of these monitoring activities. The primary purposes of this investigation were to determine adequancy of current solid-waste monitoring systems at Los Alamos Scientific Laboratory, and to determine improvements to the monitoring program to assure that radioactivity migration from burial areas could be detected. Specific information concerning the total number of curies of waste are tabulated for three sites. (Woodard-USGS)

GROUND-WATER HYDROLOGY AND GEOLOGY NEAR THE JULY 1974 PHENOL SPILL AT LAKE BEULAH, WALWORTH COUNTY, WISCONSIN,
Wisconsin Geological Survey, Madison.
R. G. Borman.
Wisconsin Geological and Natural History Survey, Madison, Special Report Number 4, June 1975. 13 p, 4 fig, 1 tab.

Descriptors: *Water pollution sources, *Soil contamination, *Phenols, *Path of pollutants, *Groundwater, *Wisconsin, Data collections, Tracking techniques, Geology, Hydrogeology, Sampling, Water wells, Chemical analysis, Groundwater movement.
Identifiers: *Phenol spill, *Walworth County(Wis).

Lake Beulah, a village in Walworth County, Wisconsin, was the site of a 9,000-gallon (34,000-litre) phenol spill in July 1974. This report provides basic data and information on the groundwater hydrology and geology in the vicinity of the spill. The phenol reached the water table, and groundwater containing phenol is moving southeast through the sand-and-gravel and the Niagara aquifers and should discharge to streams and ditches tributary to Honey Creek. The underlying sandstone aquifer (Cambrian and Ordovician strata) should be unaffected by phenol from the spill because it is overlain by the Maquoketa Shale, which forms a barrier to vertical groundwater movement. (Woodard-USGS)

COMBINED EFFECTS OF MERCURY A TEMPERATURE ON THE MORTALITY RAINBOW TROUT,
Battelle-Pacific Northwest Labs., Richla Wash. Ecosystems Dept.
T. O. Thatcher.
In: CONF-730505, Proceedings of a symposi held at Augusta, Georgia May 3-5, 1973. p 54-5 fig, 4 ref.

Descriptors: *Temperature, *Mercu *Resistance, *Rainbow trout, Juvenile fish, Bio say, *Chemical wastes, Water pollution effec *Mortality, Thermal pollution.
Identifiers: Chemical pollutants.

Goals were to define and quantify the combi action of various water temperatures and potent chemical pollutants on fish. Mercury was select as the pollutant and juvenile rainbow trout as t experimental animal. Fourteen continuous flo through bioassays were conducted. A two to thr fold difference in resistance to the mercury w observed, depending on the temperature to whi the fish was exposed. After all fish had been acc mated to 10 C, those at 15 C were more resista than those at 10 C or 20 C. (See also W76-020 (Chilton-ERDA-HNL)

CIDENCE AND CAUSE OF GAS-BUBBLE EASE IN A HEATED EFFLUENT,
rth Carolina Wildlife Resources Commission, eigh.
W. Miller.
CONF-730505, Proceedings of a symposium d at Augusta, Georgia May 3-5, 1973. p 79-93, 3 8 tab, 15 ref. Dingell-Johnson Project F-19.

scriptors: *Heated water, *Gases, *Nitrogen, persaturation, *Fish, Diseases, Suckers, Sunfes, Bass, *North Carolina, Water sampling, rmal pollution, Water pollution effects, Water lution sources.
ntifiers: Symptoms, *Gas-bubble disease, Lake rman(NC).

h samples were collected monthly from the ted effluent of Marshall Steam Station on Lake rman, North Carolina from November 1971 to y 1972. Of the twenty-one species of fish cap-ed, nine species exhibited external symptoms gas-bubble disease such as popeye of one or h eyes and gas bubbles in the fins. The disease s most prevalent in redhorse suckers (28.6 per-t), white bass (27.8 percent), white crappies 0 percent), and redbreast sunfish (13.0 per-t). Monthly percent incidence for all fish cap-ed peaked at 4.7 percent in February. Water mples taken at the time of the fish sampling pro-m showed that heating of the intake water sed the condenser releases to be supersatu-ed with dissolved gases, particularly nitrogen. e conclusion is that the dissolved gas supersatu-on in the discharge canal and receiving cove sed the observed symptoms of gas-bubble dise in the fish. TCHING SUCCESS OF BLUEBACK-HERNG AND STRIPED-BASS EGGS WITH VARIS TIME VS. TEMPERATURE HISTORIES,
ns Hopkins Univ., Baltimore, Md. Chesapeake y Inst.
R. Schubel, and A. H. Auld.
CONF-730505, Proceedings of a symposium d at Augusta, Georgia May 3-5, 1973. p 164-170, g, 1 tab, 5 ref.

Descriptors: *Temperature, Time, *Hatching, *Herrings, Aquatic animals, *Bass, Larvae, Mortality, Fish eggs, Thermal pollution, Water pollution effects, Fish stocking.

A model plant was constructed to simulate the time versus temperature histories experienced by planktonic organisms at a power plant with a once-through cooling system. Blueback herring eggs in the 4- and 8-cell stages and in the late-embryo tail-free stage and striped-bass eggs in a late-gastrula stage were studied. The length of time for cooling back to average water temperature in the spawning grounds ranged from 30 minutes to nearly 6 hours. Absolute hatching success of experimental herring eggs was 10 to 14 percent less than in the control eggs. Absolute hatching success of experimental striped-bass eggs was 2 to 8 percent lower than those of control eggs. Microscopic examination of eggs and larvae from each experimental and control subsample failed to produce any morphological or behavioral evidence, other than higher mortalities, of abnormal development. (See also W76-02004) (Chilton-ERDA-HNL)

EFFECTS OF A THERMAL EFFLUENT ON THE AMERICAN OYSTER,
Delaware Univ., Lewes. Coll of Marine Studies.
J. C. Tinsman, and D. L. Maurer.
In: CONF-730505, Proceedings of a symposium held at Augusta, Georgia May 3-5, 1973. p 223-236, 7 fig, 33 ref.

Descriptors: *Environmental effects, *Thermal water, *Oysters, *Mortality, *Weight, Temperature, Metabolism, Reproduction, Growth rates, Resistance, Parasitism, Disease resistance, *Delaware, *Thermal pollution, Water pollution effects.
Identifiers: Crassostrea virginica, Indian River Bay(Del).

Oysters were placed in three locations in Indian River Bay, Del.: (1) at the intake canal of a fossil-fuel power plant, (2) 2.5 km downstream at the mouth of the effluent canal, and (3) 6 km downstream from the plant. Stations 1 and 3 served as control stations and Station 2 as the test site. Oysters in the heated effluent increased in shell growth because of an extension of the growing season. Meat weights and oyster condition were low during warm months. Favorable winter conditions in the effluent allowed weight and body conditions to improve and exceed the weight and body condition of oysters from the control stations. Oysters held in the effluent showed an increased rate of meat growth throughout the study. The data provide a basis for further studies of thermal effects on disease, parasitism, excessive fouling and spawning of the oyster. (See also W76-02004) (Chilton-ERDA-HNL)
W76-02009

GROWTH AND DEVELOPMENTAL RESPONSES OF LARVAL TOAD POPULATIONS TO HEATED EFFLUENT IN A SOUTH CAROLINA RESERVOIR,
Savannah River Ecology Lab., Aiken, S.C.
D. H. Nelson.
In: CONF-730505, Proceedings of a symposium held at Augusta, Georgia May 3-5, 1973. p 264-276, 2 fig, 4 tab, 24 ref. AEC AT-38-1(310).

Descriptors: *Toads, *Larvae, *Growth rates, Embryonic growth stage, *Heated water, Mortality, Thermal stress, *South Carolina, Seepage, Reservoirs, Nuclear powerplants, *Thermal pollution, Water pollution effects.
Identifiers: Bufo terrestris, Anurans, Savannah River Plant(SC).

Toad larvae were laid in cooler parts of a reservoir receiving lethal levels of heated effluent from a nuclear production reactor. Larvae were removed at weekly intervals for a comparison of growth and developmental rates in different thermal regimes under natural conditions. The cooling effect of shoreline seepage allowed successful breeding and development in restricted parts of the reservoir. High mortality of toad eggs and embryos occurred in heated sections of the reservoir. Larval growth and development is more rapid in warmer areas which are within the ranges of thermal tolerance but larval Bufo terrestris grow to a larger size at cooler temperatures. Constantly elevated temperatures prevent anurans from benefiting from the reduced thermal levels associated with nocturnal breeding. (See also W76-02004) (Chilton-ERDA-HNL)

PLANKTON ENTRAINMENT BY THE CONDENSER SYSTEMS OF NUCLEAR POWER STATIONS ON LAKE ONTARIO,
State Univ. of New York at Buffalo. Dept. of Biology.
J. F. Storr.
In: CONF-730505, Proceedings of a symposium held at Augusta, Georgia May 3-5, 1973. p 291-295, 4 ref.

Descriptors: *Entrainment, *Plankton, *Thermal stress, *Mortality, *Lake Ontario, Intakes, Discharge, Nuclear powerplants, Temperature, Condensers, Thermal pollution, Water pollution effects.
Identifiers: *Motility, Mechanical stress, Robert Emmett Ginna Nuclear Power Plant, Nine Mile Point Nuclear Station.

Entrainment studies to assess the effects of thermal and mechanical stress on plankton have been carried out at two nuclear power stations on Lake Ontario. Samples of plankton populations were obtained from the intake and discharge after passage through condenser tubes. Motility was used as the indicator of living organisms. Counts were made immediately after obtaining the samples; at the equilibration of the temperatures; and after a 24 hour interval. Temperature difference at the two stations was approximately 7C and the mean mortality of the plankton at the two stations was 18.3 percent and 25.5 percent. Latent mortality was not significant at either station after a 24 hour interval. Experiments showed that temperatures below 35C show no correlation between temperature and mortality. At temperatures above 35C, mortality increases rapidly with 100 percent mortality occurring at about 40.5C. These studies indicate that within the operational temperature ranges at these two stations, up to 20 percent of the mortality could be attributed to mechanical stress. FISH BEHAVIOR AT A THERMAL DISCHARGE INTO LAKE MICHIGAN,
Argonne National Lab., Ill. Radiological and Environmental Research Div.
G. P. Romberg, S. A. Spigarelli, W. Prepejchal, and M. M. Thommes.
In: CONF-730505, Proceedings of symposium held at Augusta, Georgia May 3-5, 1973. p 296-312, 2 fig, 6 tab, 15 ref.

Descriptors: *Thermal water, *Sport fish, *Fish behavior, Trout, Smelt, Behavior, Temperature, *Lake Michigan, Tagging, Creel census, Brook trout, Brown trout, Lake trout, Rainbow trout, Thermal pollution, Water pollution effects.
Identifiers: *Point Beach Nuclear Power Plant, *Alewife, *Echo location, Osmerus mordax, Alosa pseudo harengas, Salvelinus fontinalis, Salmo gairdneri, Salmo trutta, Salvelinus namaycush.

Frequent massive concentrations of fish were observed near the thermal discharge flumes at the Point Beach Nuclear Power Plant. Smelt and alewife represent the greatest numbers of fish,

with the smelt appearing in large schools during April and May and the alewife from May to July. Trout are the most abundant sports fish and are present at the plant throughout most of the year but the greatest concentrations coincide with the spring and fall spawning seasons. Results of a tagging study indicate a continual influx of new fish. Trout species were caught primarily at discharge temperatures below 21 C and non-trout species at warmer temperatures. Although fish often seemed to be concentrated in the discharge flumes, fish locator data from two shut down studies indicate that there was no increase in the concentration of fish in the plume area during plant operation. BEHAVIORAL THERMOREGULATION OF THE AMERICAN ALLIGATOR,
State Univ. of New York Coll. at Buffalo. Dept. of Biology.
J. R. Spotila.
In: CONF-730505, Proceedings of a symposium held at Augusta, Georgia May 3-5, 1973. p 322-334, 4 fig, 40 ref. AEC AT(38-1)-310.

Descriptors: *Reptiles, *Temperature, *Regulation, *Microenvironment, Behavior, Thermal stress, Telemetry, Water loss, Thermometer, Heat flow, Water temperature, Wind velocity, Humidity, Animal behavior.
Identifiers: *Alligators, *Thermoregulation, Climate space, Heat energy exchange, Telethermometer, Thermistor probes.

Body temperatures of two alligators were recorded under seminatural conditions in St. Louis, Missouri, using thermistor thermometers and radiotelemetry. Accurate measurement of external physical factors such as radiation, temperatures, wind speed and relative humidity were used to measure the paths of heat flow between the animal and its environment. The alligators employed thermoregulation by making use of water as a heat sink. In this way they were able to regulate their body temperature near the preferred level of 32 C to 35 C. One alligator which was tethered on land was unable to regulate its body temperature at a tolerable level even by remaining in the shade. One alligator remained partially submerged with its back exposed to the sun, thus operating between the blackbody and full-sun lines of its climate space. Also an alligator can regulate its head temperature at a level above that of body temperature by keeping its head exposed to the sun. (See also W76-02004) (Chilton-ERDA-HNL)

THERMAL EFFECTS ON THE MICROBIOLOGY AND CHEMISTRY OF THE CONNECTICUT RIVER-A SUMMARY,
Connecticut Univ., Noank. Marine Research Lab.
J. S. Rankin, J. D. Buck, and J. W. Foerster.
In: CONF-730505, Proceedings of a symposium held at Augusta, Georgia May 3-5, 1973. p 350-355, 14 ref. Federal Water Quality Act. US Dept. of Interior 14-12-77.

Descriptors: *Thermal water, *Environmental effects, *Physiochemical properties, *Microorganisms, Connecticut, *Connecticut River, Temperature, Hydrogen ion concentration, Salinity, Dissolved oxygen, Nitrogen compounds, Phosphates, Chemical analysis, Seasonal, Enteric bacteria, Anaerobic bacteria, Thermophilic bacteria, Thermal pollution, Water pollution effects.
Identifiers: *Haddam Neck Plant, Mesophiles, Psychrophiles, Proteolytic bacteria, Lipolytic bacteria, Amylolytic bacteria.

The effects of thermal effluent from a nuclear powered electricity generating station on the physical, chemical and microbiological features of a section of the Connecticut River were studied for 27 months before and 21 months after the start of operations. Physical and chemical determinations included temperature, pH, salinity, dissolved oxygen, nitrate-nitrogen, ammonia-nitrogen, total nitrogen, and ortho- and total-phosphate. Quantitative and qualitative determinations of phytoplankton and bacteria were made. No significant differences appeared in the physical and chemical determinations from the prethermal and the thermal periods. The only alterations that could be attributed to the thermal addition were qualitative shifts in population of heterotrophic mesophilic bacteria and phytoplankton and an increase in the standing crop of certain microalgae in the immediate mixing zone of effluent and the river itself. W76-02014

RESPONSE OF PERCH AND THEIR FORAGE TO THERMAL DISCHARGES IN LAKE ONTARIO,
State Univ. of New York at Buffalo. Dept. of Biology.
J. F. Storr, and G. Schlenker.
In: CONF-730505, Proceedings of a symposium held at Augusta, Georgia May 3-5, 1973. p 363-370, 6 ref.

Descriptors: *Water temperature, *Discharge, Thermal water, *Yellow perch, *White perch, *Lake Ontario, Tagging, Gill nets, Food abundance, Waves(Water), Thermal pollution, Water pollution effects.
Identifiers: Roccus americanus, Perca flavescens, Robert Emmett Ginna Nuclear Power Plant, Nine Mile Point Nuclear Station, Gammerids.

Distributional patterns of fish fauna around discharges of two nuclear power stations on Lake Ontario employing once through cooling are discussed. Tendencies of white perch (Roccus americanus) and yellow perch (Perca flavescens) to be attracted to or discouraged from inhabitating areas adjacent to the outflows under varying operational seasonal conditions are indicated. Attraction to the discharges can be attributed to protection from prevailing wave activity; increase in food supplies (specifically, increase in gammarids); residence of forage fish in the area; and temperature preferendums for prey species. When temperatures in the open lake and the outflow increase, the yellow perch avoids the warmer water of the discharge. Although evidence indicates that thermal outflows are attractive at certain times, a fish tagging program showed that normal fall migration away from the lakeshore to distant spawning areas does occur. GROWTH OF SALT MARSH MICROCOSMS SUBJECTED TO THERMAL STRESS,
City Univ. of New York. Dept. of Biology.
N. M. Saks, J. J. Lee, W. A. Muller, and S. H. Tietjen.
In: CONF-730505, Proceedings of a symposium held at Augusta, Georgia May 3-5, 1973. p 391-398, 2 fig, 2 tab, 22 ref.

Descriptors: *Temperature, *Laboratory tests, *Algae, *Salt marshes, *Growth rates, Microorganisms, *New York, Benthic fauna, Nematodes, Resistance, Thermal stress, Thermal pollution, Water pollution effects.
Identifiers: Euplotes vannus, Allogromia laticollaris, Chromadorina germanica.

Laboratory studies were conducted to determine the thermal tolerance ranges of twelve species of algae which serve as food for meiofaunal species in New York salt marshes. The thermal tolerance ranges of the twelve species varied widely. As temperature increases from 10 C to 25 C, competitive effects become apparent and blooms of particular species are conspicuous. The time for growth inhibition of the species studied at acute temperature stress of 40 C varied from fifte minutes to one hundred ninety five minutes. C timum growth temperatures for the twelve spec ranged from 25 C to 29 C. (See also W76-020 (Chilton-ERDA-HNL)

BIOLOGICAL MONITORING IN WHEEL RESERVOIR BEFORE OPERATION BROWNS FERRY NUCLEAR PLANT,
Tennessee Valley Authority, Muscle Shoals, A Div. of Environmental Planning.
M. P. Taylor.
In: CONF-730505, Proceedings of a symposiu held at Augusta, Georgia May 3-5, 1973. p 399-4 9 fig, 2 tab, 5 ref.

Descriptors: *Tennessee River, *Water quali *Baseline studies, *Bioindicators, *Benthic fau *Zooplankton, *Phytoplankton, Monitoring, D collections, Seasonal, Clams, Midges, Mayflies.
Identifiers: Brown's Ferry Nuclear Plant, C bicula manilensis, Chironomidae, Hexage bilineata.

A four year study provides a data base for chara terizing selected biota along a thirty mile reach the Tennessee River extending above and bel the Brown's Ferry Nuclear Plant. The princip application of the data is to be as a comparison biological conditions before and after the pla begins operation. Benthos and plantkon sampl were collected randomly on a quarterly sampli basis from twenty four points in eight transec Each species was analyzed separately because its variability in different seasons and years, d tribution, and longevity. In the benthic fauna, C bicula showed no extreme effects from seaso changes and therefore serves as a good indicat of long-term trends in water quality. Hexage and Chironomidae did show seasonal effects. Bo phytoplankton and zooplankton exhibit noticeab seasonal variations. (See also W76-020 (Chilton-ERDA-HNL)

SPIRATION AND NET PRODUCTIVITY OF E PLANKTON COMMUNITY IN A REAC-R COOLING RESERVOIR,
Pont de Nemours (E. I.) and Co., Aiken, S.C. annah River Lab.
. Tilly.
CONF-730505, Proceedings of a symposium d at Augusta, Georgia May 3-5, 1973. p 462-474, b, 4 fig, 18 ref. AEC AT(07-2)-1.

scriptors: *Thermal water, *Respiration, oductivity, *Plankton, Environmental effects, ton, Reservoirs, Depth, Surface waters, uth Carolina, Biological communities, Thermal lution, Water pollution effects, Cooling water.
ntifiers: *Net productivity, Savannah er(SC).

e influence of heat on the respiration and net ductivity of a plankton community near the rmal discharge of the Savannah River Plant, ken, S.C. is studied. Results of net productivity dies show a tendency for the warm station to be re productive than the cool station and that this dency increases from winter to summer. Max-um productivity also occurs at a shallower th at the warm station. Respiration per unit ight of the seston was unexpectedly found to be ater at the cool station year around. Although th profiles indicated increases in near-surface es, primary productivity per unit area was less luenced by the thermal effluent than was piration because of an offsetting decrease in bon fixation with depth at the warm station. e also W76-02004) (Chilton-ERDA-HNL)

TAL METABOLISM OF THERMALLY AF-CTED COASTAL SYSTEMS ON THE WEST AST OF FLORIDA,
rida Univ., Gainesville. Dept. of Environmen-Engineering Sciences.
H. B. Smith, H. McKellar, D. L. Young, and E. Lehman.
CONF-730505, Proceedings of a Symposium d at Augusta, Georgia May 3-5, 1973, p 475-489, ab, 4 fig, 13 ref.

Descriptors: *Thermal water, *Metabolism, *Respiration, *Photosynthesis, *Estuarine environment, Oxygen demand, Canals, Bays, *Florida, Ecosystems, Thermal pollution, Water pollution effects.
Identifiers: *Crystal River(Fla).

The diurnal oxygen curve method was used to measure total community metabolism at Crystal River Power Plant on Florida's west coast. Mean summer values of both net daytime photosynthesis and night respiration in the bay systems were about 4 to 5 grams oxygen per square meter per day. Winter values were generally one-half to one-third the summer values. No significant difference between affected and control areas was demonstrated. The photosynthesis-respiration ratios were near 1 in the summer and dropped below 1 in the winter. Studies on total metabolism measurements in the intake and discharge canals of the power plant indicated that photosynthesis-respiration ratios ranged from 0.02 to 0.50. During October, the net daytime production in the discharge canal was 80 percent lower than in the intake canale while nightime respiration was five times higher. During February total metabolism in both canals was 50 percent lower. The 124 acres canals produced 70 to 75 percent less oxygen than the same area of bay ecosystem and respired about 1.5 times more oxygen than the same area of bay. INFLUENCE OF TEMPERATURE ON THE PHOTOSYNTHETIC EFFICIENCY IN NATURAL POPULATIONS OF MARINE PHYTOPLANKTON,
Massachusetts Univ., Glouchester. Marine Station.
C. S. Yentsch, C. M. Yentsch, L. R. Strube, and I. Morris.
In: CONF-730505, Proceedings of a Symposium held at Augusta, Georgia May 3-5, 1973, p 508-517, 6 fig, 11 ref. AEC AT(11-1)3024, NSF GA 29501.

Descriptors: *Temperature, *Photosynthesis, *Phytoplankton, *Aquatic populations, Seasonal, Measurements, Growth rates, Curves, Marine plants.
Identifiers: *Acclimatize, Photosynthetic efficiency, *Gulf of Maine.

The photosynthesis versus temperature relationships of natural populations of the Gulf of Maine were examined. The seasonal temperature cycle ranges from approximately -1.5C to 18C. Seasonal phytoplankton growth is characterized by low populations in winter, a spring bloom, and smaller blooms during the summer. Phytoplankton photosynthesis was maximum between 14 and 17C. The water temperature at the time of sampling ranged from 2.3C to 17.3C. Data indicate that populations were not adapted to water temperatures. A curve describing the relationships between temperature and photosynthetic efficiency was derived from data points. (See also W76-02004) (Chilton-ERDA-HNL)

EFFECT OF THERMAL EFFLUENTS ON THE MARINE BIOLOGY OF SOUTHEASTERN FLORIDA,
Miami Univ., Fla. Dept. of Microbiology.
A. Thorhaug.
In: CONF-730505, Proceedings of a Symposium held at Augusta, Georgia May 3-5, 1973, p 518-531. 7 fig, 16 ref.

Descriptors: *Heated water, *Marine algae, *Marine plants, *Estuaries, On-site investigations, Laboratory tests, Biological communities, Ecosystems, *Florida, Thermal pollution, Water pollution effects.
Identifiers: *Turtle grass, *Macroalgae, Biscayne Bay(Fla), Card Sound(Fla), Thalassia testudinum, Green algae, Penicillus capitatus, Halimeda incrassata, Rhipocephalus phoenix, Udotea flabellum, Avrainvilla, Red algae, Laurencia poitei.

Results are presented of a three year field and laboratory investigation on the effects of heated effluents from fossil-fuel and nuclear power plants discharged into shallow estuaries of Biscayne Bay and Card Sound. At temperatures 3 to 4 C above ambient the Thalassia community declined by about 50 percent and macroalgae fell to about 30 percent of the former population resulting in an overall loss of nutrients. In 1972, changes in the effluent pumping system caused production increase of Thalassia of 40 percent in areas where the heating was lowered but production farther out in the bay declined as the increased volume flow caused the effluent plume to extend further into midbay. Mean standing crops for algae show temperature dependence. Data indicate that maximum standing crop of the seven major species occurred at 30 to 31 C. None of the important macroalgae survived above 34 C. (See also W76-02004) (Chilton-ERDA-HNL)
W76-02023

STUDIES OF FLORIDA GULF COAST SALT MARSHES RECEIVING THERMAL DISCHARGES,
Florida Univ., Gainesville, Fla. Dept. of Environmental Engineering Sciences.
D. L. Young.
In: CONF-730505, Proceedings of a Symposium held at Augusta, Georgia May 3-5, 1973, p 532-550. 5 fig, 4 tab, 26 ref.

Descriptors: *Heated water, *Salt marshes, *Metabolism, *Productivity, *Respiration, Ecosystem, Water temperature, Seasonal, Snails, Animal populations, *Florida, Thermal pollution, Water pollution effects.
Identifiers: *Spartina alterniflora, Littorina irrorata, Uca, Fiddler crabs, Crystal River.

A salt marsh receiving thermal effluents from an electricity-generating station and two marshes not receiving thermal additions were studied. Indexes of overall community structure and metabolism were chosen to evaluate the effect of thermal discharges. Monthly harvest samples of Spartina standing crop, in-situ infrared gas analysis measurements of metabolism, and litter-bag experiments were undertaken to investigate the effect of effluents on standing crop and net production, respiration and total metabolism and decomposition. Water temperatures in the thermally affected marsh averaged 3-6C warmer than in the control marshes. The apparent net production calculated was 547 gms. per sq. meter(dry weight) in the thermal marsh and 282 gms. per sq. meter(dry weight) in the control marsh. Community metabolism measurements indicated community respiration in the thermally affected marsh to be twice that in the control marsh. Population comparisons of snails and fiddler crabs were made. Snails showed no difference in numbers but crabs were less numerous in the thermally affected marsh. (See also W76-02004) (Chilton-ERDA-HNL)

POTENTIAL USE OF VEGETATION TO ENHANCE COOLING IN HOLDING PONDS,
California State Univ., San Diego. Dept. of Biology.
P. C. Miller.
In: CONF-730505, Proceedings of a Symposium held at Augusta, Georgia May 3-5, 1973, p 610-627. 5 fig, 2 tab, 28 ref.

Descriptors: *Heat transfer, *Mangrove swamps, *Model studies, *Canopy, Vegetation, Cooling, Heated water, Resevoirs, Solar radiation, Surfaces, *Florida, Water vapor, Thermal pollution, Water pollution.
Identifiers: *Leaf Area Index.

A simulation model was used to study the transport of heat and water vapor through mangrove canopies in cooling ponds in south Florida. Simulations with the model using realistic water flow rate and extreme environmental conditions indicated that if the vegetation were left intact the natural environment would be much less affected and the water would cool to ambient before recycling through the power plant. Carbohydrate production in the canopies and transfer of heat and water vapor from the surface are dependent upon Leaf Area Index of the canopy. The mangroves are expected to experience increased, but not severely detrimental, water stress owing to the hot water. (See also W76-02004) (Chilton-ERDA-HNL)

TIDAL FLATS IN ESTUARINE WATER QUALITY ANALYSIS,
Oregon State Univ., Corvallis. Dept. of Civil Engineering.
D. A. Bella.
Available from the National Technical Information Service, Springfield, Va 22161. Environmental Protection Agency, Report EPA-660/3-75-025, June 1975. 184 p, 37 fig, 19 tab, 89 ref, append. EPA-660/3-75-025. 1BA025. Grant 16070 DGO.

Descriptors: Estuaries, *Estuarine environmental, Ecosystems, Water quality, *Tidal hydraulics, *Sulfates, *Mixing, Path of Pollutants, Ecology, Water pollution effects, Simulation analysis, *Sulfides, Toxicity., *Benthas.
Identifiers: Yaquina Estuary(Ore).

The initial phases of the study involved mixing processes and tidal hydraulics; however, the study emphasis shifted to estuaries benthic systems as the importance of these systems became more apparent. A conceptual model of estuarine benthic systems was developed and a classification system of estuarine benthic deposits which is based on the availability of hydrogen acceptors and reactive iron was developed. Field studeis demonstrated that estuarine sediments and overlying wastes could contain significant concentrations of free sulfides which are toxic to a variety of organisms. Field studies of benthic oxygen uptake and benthic sulfide release were conducted. Water quality profiles within the deposits also were determined. A number of laboratory studies were conducted to determine the rate of sulfate reduction. Results from experiments using extracts from benthic deposits and algal mats demonstrated a close relationship between the rate of sulfate reduction and the sulfate and soluble organic carbon concentrations. A general systems model of estuarine benthic systems was developed. A variety of activities which could contribute to significant environmental changes with estuarine benthic systems were identified. Methods of determining dispersion coefficients from salinity profiles were examined and an improved method was developed. The build-up of a pollutant in the vicinity of the outfall during the slack water period of tide was studied through a field experiment and mathematical model. (EPA)

Gig Sanit. 9 p 72-74, 1974.

Descriptors: *Viruses, Surface water, Europe, *Epidemiology, Human diseases, *Public health.
Identifiers: Coxsakievirus, *East Germany, Echovirus, Picornaviruses, Poliovirus, Virological studies.

Various serotypes and concentrations of viruses (polio, Coxsackie A and B, ECHO) were found in all investigated waters in East Germany. The seasonal distribution of the virus-positive water samples indicated a maximum of viruses in the water in June-Aug., which apparently is related to the intensity of the anthropogenic factor. Sanitary-virological investigations of natural waters and epidemiological observations of selected population groups can elucidate mechanisms of spread of virus infections. --Copyright 1975, Biological Abstracts, Inc.

EFFECTS OF ENTRAINMENT OF ZOOPLANKTON AT THREE MID-ATLANTIC POWER PLANTS,
Johns Hopkins Univ., Baltimore, Md. Dept. of Geography and Environmental Engineering.
R. M. Davies, and L. D. Jensen.
Available from the National Technical Information Service, Springfield, Va 22161 as PB-240 755, $5.00 in paper copy, $2.25 in microfiche. Prepared for Electric Power Research Institute, Cooling Water Discharge Research Project (RP-49), March 1974, 76 p, 49 fig, 24 tab, 48 ref.

Descriptors: *Entrainment, *Powerplants, *Heated water, Movement, *Discharge(Water), *Temperature, *On-site data collections, *Zooplankton, *Cooling water, Aquatic life, Aquatic animals, Aquatic microorganisms, Methodology, Sampling, Chlorination, Chlorine, Analytical techniques, *Thermal pollution, Water pollution effects.
Identifiers: *Motility, Lake Norman(North Carolina), James River(Virginia), Indian River(Delaware).

The passage of zooplankton through the power plants on Lake Norman, North Carolina, James River, Virginia and Indian River Estuar Delaware was studied. Live samples were c lected by means of paired time coordinate pump one for intake and one for discharge. Zooplankt motility was mutually dependent upon temper ture rise through the power plant and intake te perature. At Lake Norman, zooplankton show only minimal damage from entrainment at highe summer temperatures (22 degrees C), but in win suffered 40 to 50 percent decrease in motility wh temperature rise increased from 11 to 20 degre C. Motility of entrained plankton dropped belo 50 percent at James River when intake water te perature exceeded 22 degrees C. At warme summer discharge temperatures (above 27C Lake Norman, 40C at James River, 36C at Indi River) zooplankton were less numerous in sampl from the discharge port than those from the mixi zone. S. L. Serns, and K. Strawn.
Transactions of the American Fisheries Society, p 506-512, No 3, 1975. 5 fig, 3 tab, 17 ref.

Descriptors: *Growth rates, *Freshwater fish, *Reservoirs, Heated water, Fish physiology, Water quality, Equations, *Sunfishes, Texas, Thermal pollution.
Identifiers: Fish scales, Scale reading, Lake Bastrop(Tex), Lake Nasworthy(Tex).

The method of determining age and growth by scale readings was used for bluegills, Lepomis macrochirus, in two heated reservoirs. Females grew faster in both lakes. Annulus formation occurred from January through July, with no growth from November through January. Growth of bluegills in the two lakes was above that reported in the literature. Length-weight regression equations were determined for bluegills. (Klein)

DD HABITS OF ICTALURUS NUBULOSUS ACID POLLUTED WATER OF NORTHERN ST VIRGINIA,
t Virginia Univ., Morgantown. Dept. of Biolo-

. Klarberg, and A. Benson.
nsactions of the American Fisheries Society, p 547, No 3, 1975, 6 tab, 17 ref.

criptors: *Bullheads, *Fish food organisms, ochaetes, Detritus, Sewage, Acids, Nutrient irements, Algae, Water quality, Water pollu- effects, Invertebrates, Chironomids, West ginia.
tifiers: Monongahela River(W Va).

d habits of the brown bullhead, Ictalurus nebu-s, were investigated in an acid polluted river compared with a pollution-free pond. ochaetes were the most important inver-ates food source in the river, whereas onomid larvae were the most important inver-ates consumed in the pond. Also consumed in pond was detritus and algae, and sewage in the r. No qualitative difference in food habits was ed between different size groups of fish in er acid or non-acid situations. The brown bull-d was able to meet its nutritional requirements n detritus, sewage, and acid-tolerant inver-ates. (Klein)

XICITIES OF CRUDE OILS AND OIL-SPERSANT MIXTURES TO JUVENILE RAB-TFISH, SIGANUS RIVULATUS,
tional Marine Water Quality Lab., West King-n, R. I.
Eisler, and G. W. Kissil.
nsactions of the American Fisheries Society, 3, p 571-577, 1975, 6 tab, 13 ref.

scriptors: *Toxicity, *Oil wastes, *Fish, boratory tests, Lethal limit, Salinity, Bioassay, h physiology, Water pollution effects.
ntifiers: *Crude oil, *Oil dispersants, ST5, abbitfish, Bioaccumulation.

xicities were determined for two crude oils (one m the Persian Gulf (Iran) and one from the ai Peninsula), ST5, a chemical oil dispersant, l oil-ST5 mixtures (10:1 ratio) to rabbitfish, anus rivulatus. The LC50 was 0.74 ml/liter for Iranian crude oil, 14.5 ml/l for Sinai crude, and 10 ml/l for oil-ST5 mixtures. Iranian oil became s toxic with increasing time in seawater; the erse was observed for Sinai crude. ST5 ex-ited a dramatic reduction in lethality after 2 urs. Liver enlargement in rabbitfish was linked h exposure to high concentrations of crude oil. gh sublethal levels of ST5 caused reductions in od hematocrit. Rabbitfish survival was highest 30-50% salinity. Rabbitfish were more resistant crudes and oil-dispersant mixtures in continu-s flow bioassays conducted in large tanks than static jar bioassays. XICITY OF POTASSIUM PERMANGANATE FISH AND ITS EFFECTIVENESS FOR TOXIFYING ANTIMYCIN,
reau of Sport Fisheries and Wildlife La Crosse, is. Fish Control Lab.
L. Marking, and T. D. Bills.
ansactions of the American Fisheries Society, 3, p 579-583, 1975, 1 fig, 4 tab, 16 ref.

Descriptors: *Toxicity, *Pottasium compounds, *Piscicides, *Antibiotics(Pesticides), *Channel catfish, Freshwater fish, Water quality, Water pollution effects.
Identifiers: Bioaccumulation, Potassium, Permanganate, *Goldfish, *Antimycin, Detoxifying Agent.

The 96-h LC50's for potassium permanganate (KMn04) ranged from 0.75 milligrams/liter with channel catfish, Ictalurus punctatus, to 3.6 milligrams/liter with goldfish, Carcassius auratus, in laboratory tests. The toxicity of KMn04 was greatest in water of lower temperatures in harder water, or in higher pH water. KMn04 was effective for detoxifying the fish toxicant antimycin in waters of pH 6.5-9.5. The half-life for antimycin exposed to 1.0 milligram/liter of KMn04 ranged from 7 to 11 minutes in the different pH waters at 12C.

THE LOWER TROPHIC LEVEL TOXICITY ASSESSMENT IN THE GOLDEN HORN AREA IN ISTANBUL,
Technical Univ. of Istanbul (Turkey). Dept of Engineering and Architecture.
D. Orhon.
Water Research, Vol 9, No 5/6, p 467-472, May/June, 1975, 13 fig, 11 ref.

Descriptors: *Trophic level, *Respiration, *Photosynthesis, *Bioassay, Toxicity, Methodology, Metabolism, Ecosystems, Environmental effects, Metals, Mercury, Lead, Copper, Zinc.
Identifiers: Instanbul, *Turkey.

Toxicity in the Golden Horn estuary was studied by means of lower trophic level bioassays. Respiration and photosynthesis rates of the bioassay communities developed in situ were found to be significant response parameters of the toxicity. Changes in the metabolic responses upon addition of toxic chemicals were evaluated in terms of the toxic potential of these substances, with regard to future ecological balance-pollution problems. (Klein)
W76-02324

THE RELATIONSHIP OF THE 96-HOUR LC50 TO THE LETHAL THRESHOLD CONCENTRATION OF HEXAVALENT CHROMIUM, PHENOL, AND SODIUM PENTACHLOROPHENATE FOR FAT-HEAD MINNOWS (PIMEPHALES PROMELAS RAFINESQUE),
Minnesota Univ., St. Paul. Dept of Entomology, Fisheries and Wildlife.
R. G. Ruesink, and L. L. Smith, Jr.
Transactions of the American Fisheries Society, No 3, p 567-569, 1975, 2 tab, 12 ref.

Descriptors: *Toxicity, *Lethal limit, *Minnows, *Chromium, *Organic compounds, *Phenols, Bioassay, Water quality, Temperature, Water pollution effects.
Identifiers: *Fathead minnows, Bioaccumulation, Hexavalent chromium, *Sodium Pentachlorophenate.

Short-term bioassays were conducted with fathead minnows, Pimephales promelas, and hexavalent chromium, phenol, and sodium pentachlorophenate at 2 temperatures to determine the relationship of the 96-hr LC50 to the lethal threshold concentration. The lethal threshold concentration was less than the 96-hr LC50 in 10 of 12 bioassays, was affected by temperature, and was not a constant multiple of the 96-hr LC50 for any of the toxicants tested. (Klein)
W76-02325

SOME EFFECTS OF STOCKING FISH IN WASTE TREATMENT PONDS,
Agricultural Research Organization, Dor (Israel). Fish and Aquaculture Station.
G. L. Schroeder.
Water Research, Vol 9, No 5/6, p 591-593, May/June, 1975, 2 tab, 9 ref.

Descriptors: *Fish, *Waste treatment, *Fish stocking, Nutrient removal, Dissolved oxygen, Bacteria, Sewage, Ecosystems, Plankton, Benthic Fauna, Water pollution effects.

The addition of fish to waste treatment oxidation ponds appeared to be an effective means of utilizing plankton and bottom fauna. The fish produced a system that was thought to be better balanced biologically. The results included overall higher dissolved oxygen concentration and higher pH within the pond. The changes improved the effectiveness of a waste treatment pond by reducing BOD and removing nutrients from the water. Bacteria concentrations were as much as 15 times lower in fish stocked treatment ponds as compared with unstocked ponds. (Klein)

FLUX OF CADMIUM THROUGH EUPHAUSIIDS,
International Lab. of Marine Radioactivity, Monte Carlo (Monaco). Oceanographic Museum.
G. Benayoun, S. W. Fowler, and B. Oregioni.
Marine Biology, Vol 27, No 3, p 205-212, 1974, 4 fig, 3 tab, 29 ref.

Descriptors: *Cadmium, *Food chains, *Heavy metals, *Absorption, *Path of pollutants, *Zooplankton, *Food webs, *Radioisotopes, *Cadmium radioisotopes, Toxicants, Water pollution sources, Public health, Laboratory tests, Mathematical models, Metals.
Identifiers: Bioaccumulation, Meganyctiphanes norvegica, *Euphausiids, Excretion, Fecal pellets, Tissue analysis.

Flux of the heavy metal cadmium through the euphausiid Meganyctiphanes norvegica was examined. Radiotracer experiments showed that cadmium can be accumulated either directly from water or through the food chain. Experimentation indicates that exchange between cadmium in the water and that in euphausiid tissue is a relatively slow processs and ingestion of cadmium is probably the more important route for accumulation. Approximately 10% of cadmium from radioactive Artemia ingested by euphausiids was incorporated into internal tissues. After one month, cadmium accumulated directly from water was most concentrated in the viscera. From comparisons of all routes by which cadmium can be released from M. norvegica to the water column, it is concluded that fecal pellet deposition represents the principal mechanism effecting the downward vertical transport of cadmium by this species. Fecal pellets accounted for 84% of the total cadmium flux. (Katz)

SURVIVAL AND CHLORIDE ION REGULATION OF THE PORCELAIN CRAB PETROLISTHES ARMATUS EXPOSED TO MERCURY,
Texas A and M Univ., College Station. Dept. of Biology.
G. Roesijadi, S. R. Petrocelli, J. W. Anderson, B. J. Presley, and R. Sims.
Marine Biology, Vol 27, No 3, p 213-217, 1974, 3 fig, 2 tab, 20 ref.

Descriptors: *Mercury, Animal physiology, *Salinity, *Bioassay, *Ion exchange, *Lethal limit, *Ion transport, Chlorides, Invertebrates, Laboratory tests, Aquatic animals, Shellfish, Crustaceans, Water pollution effects, Metals, Regulation, Osmosis.
Identifiers: Survival, Petrolishthes armatus, *Osmoregulation, *Chloride ion regulation, *Sublethal effects, Porcelain crab, Blood analysis.

LIBRARY U. OF I. URBANA-CHAMPAIGN

Acute toxicity bioassays conducted at various salinities demonstrated that mercury (as mercuric chloride) at low concentrations was lethal to Petrolishthes armatus. Ninety-six hour LC50 values varied from 50 to 64 parts per billion (ppb) of mercury, depending on test salinities. Lower salinities decreased the time to death of mercury-exposed crabs. Differences in survival after 96 hr due to salinity were not statistically significant. Blood chloride concentrations were regulated hyper-chloride to the medium at low salinities and hypo-chloride at high salinities by acclimated crabs. The salinity isochloride to blood was 22% S. Transfer of crabs from 15% S to salinities ranging from 7 to 35% S resulted in new steady-state chloride levels within 12 hr. Exposure to 50 ppb mercury did not alter chloride ion regulation of either accimilated crabs or crabs adjusting to new salinities. (Katz)
W76-02328

CRITICAL THERMAL MAXIMA AND UPPER LETHAL TEMPERATURES FOR THE CALANOID COPEPODS ACARTIA TONSA AND A. CLAUSI,
National Marine Water Quality Lab., West Kingston, R. I.
J. G. Gonzalez.
Marine Biology, Vol 27, No 3, p 219-223, 1974, 3 fig, 26 ref, 1 tab.

Descriptors: *Temperature, *Lethal limits, *Heated water, *Copepods, *Distribution patterns, Resistance, Estuaries, Temperate, Laboratory tests, Methodology, Thermal pollution, Water pollution effects.
Identifiers: Critical thermal maxima, Acartia tonsa, Acartia clausi, *Thermal tolerance, Acclimination, CTM.

Determination of the critical thermal maxima and upper lethal temperatures for Acartia tonsa and A. clausi revealed the relative temperature tolerance of the two species. A. tonsa exhibited a wider range of acclimation temperatures compared with A. clausi which relates to its ubiquity in Atlantic Ocean estuaries, both temperate and tropical, and its capacity to live in temperate waters during most of the year. Differences between upper lethal temperatures and critical thermal maxima were very narrow for A. tonsa from tropical and subtropical areas. This suggests that, in warm climates, this copepod lives close to its upper thermal temperature limits. (Katz)

COMPARATIVE TOXICITY OF LARVAL LAMPRICIDE (TFM: 3-TRIFLUOROMETHYL-4-NITROPHENOL) TO SELECTED BENTHIC MACROINVERTEBRATES,
Michigan State Univ., East Lansing. Dept. of Fisheries and Wildlife.
A. W. Maki, L. Geissel, and H. E. Johnson.
Journal of the Fisheries Research Board of Canada, Vol 32, No 8, p 1455-1459, August 1975, 2 tab, 12 ref.

Descriptors: *Benthos, *Invertebrates, *Crustaceans, *Marine insects, *Organic compounds, *Toxicity, Lethal limit, Crayfish, Mayflies, Dragonflies, Dobsonflies, Animal physiology, Growth cycles.
Identifiers: Larval lampricides, TFM, *Bioaccumulation, 3-trifluoromethyl-4-nitrophenol, Tissue analysis, Blackfly, Simulium pugetense, Orconectes propinquus, Chauloides sp, Ophigomphus sp, Ligumia sp, Ephemerella cornuta.

The acute toxicity of larval lampricide (TFM: 3-trifluoromethyl-4-nitrophenol) to 35 species of benthic macroinvertebrates was determined in 96-h flow-through tests. The 96-hr LC50 values range from 2.1 mg/liter for blackfly larvae, Simulium pugetense, to value s in excess of 38.0 mg/liter for species with heavy exoskeletons: crayfish (Orconectes propinquus), dobsonfly larvae (Chauloides sp), and dragonfly naiads (Ophiogomphus sp). Younger individuals of the clam (Ligumia sp) and the mayflay nymph (Ephermerella cornuta) were 2 to 1.5 times more sensitive than larger individuals of the same species. Early emergence of adults and increased locomotor activity were observed among some organisms exposed to sublethal concentrations. (Klein)

HEAT EFFECTS ON A MARINE SNAIL,
Chicago Univ., Ill. Dept. of Zoology.
R. J. Hamby.
Biological Bulletin, Vol 149, No 2, p 331-347, October 1975, 5 fig, 3 tab, 35 ref.

Descriptors: *Snails, *Temperature, Animal physiology, Water quality, Analytical techniques, *Thermal pollution, Water pollution effects.
Identifiers: *Littorina littorea, *Nervous system, Tissue analysis, Acclimation.

Littorina littorea was found to be capable of coping with long-term and short-term changes in environmental temperature. Measurements of spontaneous activity of the central nervous system of the snails showed good agreement between temperature of cessation of spontaneous activity and temperature of heat coma in 5C and 25C acclimated snails. Analysis of nervous activity showed that increase in activity with rising temperature was based upon both a greater frequency of firing of single units and activation new units. Single unit frequency appeared to show no acclimation effect except in the temperature of cessation of activity. (Klein)
W76-02333

EFFECTS OF HYPOXIA ON THE BREATHING RATE, HEART RATE AND RATE OF OXYGEN CONSUMPTION IN FISHES,
Kyushu Univ., Fukuoka (Japan).
T. Nakanishi, and Y. Itzawa.
Report of Fishery Research Laboratory, Kyushu University, No 2, p 41-52, 1974, 20 fig, 20 ref.

Descriptors: *Fresh water fish, *Marine fish, *Respiration, *Oxygen demand, *Fish physiology, Rainbow trout, Carp, Eeels, Methodology, Water quality, Environmental effects, Water pollution effects.
Identifiers: Heart rate, *Hypoxia, Salmo gairdneri, Cyprinus carpio, Anguilla japonica, Chrysophrys major, Sebasticus marmoratus, Sebastes inermis.

Breathing rate, heart rate and rate of oxygen consumption were highest in the rainbow trout, lowest in the Japanese eel, and intermediate in the carp, among the three freshwater fishes. Breathing rate was highest in the sea bream, lowest in a rockfish, Sebasticus, and intermediate in another rockfish, Sebastes, among the three marine fishes. These orders were considered to coincide with the orders of their activity. Thermal coefficient, Q10, between 11.4 degrees C and 23.9 degrees C was 1.60 in breathing rate and 1.47 in heart rate of the eel. Breathing rate and heart rate showed adju mental changes during hypoxia. Rate of oxyg consumption showed a recovery from the init decrease at the stage of markedly increased ve tilation and decreased at extreme hypoxia. Chan of breathing rate and heart rate by hypoxic cond tion in the eel occurred at higher saturation of o ygen at higher temperature. Oxygen residue hypoxic death was lowest in the eel, highest in t rainbow trout, and intermediate in the carp. Th order was considered to coincide with the order resistability of the fishes to poor oxygen conditio (Katz)

THE EFFECTS OF PESTICIDES ON BRITIS WILDLIFE,
S. Cramp.
Br Vet J. Vol 129, No 4, p 315-323, 1973. Illus.

Descriptors: *Pesticides, Pesticide residue *Wildlife, *Birds, Aldrin, *Chlorinated hydroca bon pesticides, Dieldrin, Insecticides, Lethal lim Water pollution effects, Polychlorinated biphe yls.
Identifiers: *Great Britain.

The effects of pesticides on wildlife, especial birds, in Britain, are relatively well documente The main danger is from pesticides such as the o ganochlorines, which persist and accumulate species at the ends of food chains. The 1st bi casualties occurred in the early 1950's, a became severe later in the decade with the i troduction of aldrin and dieldrin seed dressing These mass kills largely ceased after voluntar restrictions were agreed in 1961 and disquiet w then caused by the declines in certain birds prey. These were due to sublethal effects on fe tility including the laying of thin eggshells a direct mortality. There was a slight recovery, fo lowing further restrictions on organochlorine from 1966. High pesticide residues (and in 1 sp cies, thin eggshells) were reported in fish eati birds of freshwater and marine habitats, but n clear link between population declines in some these and pesticides was established. The positio is complicated, especially for seabirds, by oth marine pollutants, such as oil and polychlorinate biphenyls. For most other birds, and mammal knowledge of population trends is limite Although deaths have occurred there is n evidence of lasting effects on numbers. The valu of wild life to indicate possible damage by enviro mental pollutants is stressed.--Copyright 197 Biological Abstracts, Inc.

EVALUATING A MATHEMATICAL MODEL FOR PREDICTING LAKE EUTROPHICATION,
Virginia Univ., Charlottesville. Dept. of Enviro mental Sciences.
G. M. Hornberger, M. G. Kelly, and T. C. Lederman.
Available from the National Technical Informa tion Service, Springfield, Va 22161 as PB-248 04 $5.50 in paper copy, $2.25 in microfiche. Virgini Water Resources Research Center, Blacksburg VPI-WRRC Bulletin 82, September 1975. 102 p, fig, 6 tab, 50 ref, 2 append. OWRT A-045-VA(2).

Descriptors: *Mathematical models, Testing Evaluation, Ecosystm, *Model studies *Eutrophication, Lakes, Ecology, Environmenta effects, *Forecasting, Nutrients, Phytoplankton Computer models, *Growth rates, Water pollutio effects.
Identifiers: *Predictive models, Species diversity *Lakes ecosystem models.

This research project developed a mathematica model of a lake ecosystem and then tested its abili ty to indicate what ecological changes-in particula eutrophication-would result from changes in the physical environment. The model was developed using a digital computer. In situ enrichment experi

than were performed to assess the relation-
between nutrient concentrations and the
h of phytoplankton. The investigation in-
d an evaluation of the use of non-linear
ieter estimation in determining the model's
h constants. The model did demonstrate that
uld provide useful qualitative information.
experiments did not, however, produce data
le for quantifying the relationship between
es diversity and nutrient addition showed that
ersity index holds little promise for use as a
itative indicator of eutrophic conditions. The
experiments and the study of parameter esti-
n indicate that in situ enrichment experi-
will not provide adequate data for accurate
mination of model parameters. Growth
ieters can be estimated on the basis of care-
boratory experiments, but extrapolation of
ata to field conditions proved questionable.
his reason and others, the principal applica-
of lake ecosystem models is for qualitative
minations. Even for this limited use, each
l must be carefully designed for each specific
cation.

EFFECTS OF AROCLOR 1016 ON EMBRYOS, FRY, JUVENILES, AND ADULTS OF SHEEPHEAD MINNOWS (CYPRINODON VARIEGATUS),
Environmental Protection Agency, Gulf Breeze, Fla. Gulf Breeze Lab.
D. J. Hansen, S. C. Schimmel, and J. Forester.
Transactions of the American Fisheries Society, No 3, p 584-588, 1975. 4 tab, 12 ref.

Descriptors: *Growth stages, *Polychlorinated biphenyls, Aroclors, *Minnows, Water quality, Bioassay, *Toxicity, Water pollution sources, Fish eggs, Fry, Water pollution effects.
Identifiers: *Aroclor 1016, *Sheepshead minnow, Bioaccumulation.

The toxicity of Aroclor 1016 to various growth stages of sheepshead minnow (Cyprinodon variegatus) was investigated in intermittent-flow bioassays lasting 28 days. Survival of eggs, of fry hatched from them, and of juvenile and adult fish was not affected by 0.1-10 micrograms/liter of Aroclor 1016 added to aquaria, but 32-100 micrograms/liter killed newly hatched fry and juvenile and adult fish. Sheepshead minnows accumulated the chemical in proportion to its concentration in the test water. As much as 77 micrograms/gram of Aroclor 1016 in eggs from exposed adults apparently did not affect survival of embryos and fry. (Klein)

SURVIVAL AND GROWTH OF JUVENILE STRIPED BASS, MORONE SAXATILIS, IN A FACTORIAL EXPERIMENT WITH TEMPERATURE, SALINITY, AND AGE,
Virginia Inst. of Marine Science, Gloucester Point.
W. S. Otwell, and J. V. Merriner.
Transactions of the American Fisheries Society, No 3, p 560-566, 1975. 1 fig, 6 tab, 14 ref.

Descriptors: *Striped bass, *Juvenile growth stage, *Survival, *Growth rates, *Water quality, *Salinity, *Temperature.

A 3n factorial experiment to evaluate the effects of an abrupt transfer of striped bass, Morone saxatilis, from a closed system rearing facility to a variety of experimental temperature and salinity combinations demonstrated a considerable hardiness of juvenile fish. Striped bass less than two months old had over 80% survival during seven days subsequent to acute introduction from the rearing facility into temperatures of 18C or 24C and salinities of 4 ppt or 12 ppt. Relative growth in these treatments was monitored, and the results suggested a degree of flexibility for stocking programs into estuaries. (Klein)
W76-02390

TOXICITY OF JELLIED POLYACRYLAMIDE TO OLYZIAS LATIPES AND ITS GROWTH INHIBITING ACTION TO PORPHYRA TENERA, (IN JAPANESE),
Kyushu Univ., Fukuoka (Japan).
S. Ishio, and H. Nakagawa.
Report of Fishery Research Laboratory, Kyushu University, No 2, p 79-89, 1974. 5 fig, 5 tab, 14 ref.

Descriptors: *Toxicity, *Organic compounds, Fish, Hydrogen ion concentration, Growth rate, Inhibition, Ammonia, Biochemistry, Analytical techniques, Water pollution effects.
Identifiers: Olyzias latipes, Porphyra tenera, Jellied polyacrylamides.

The toxicity of jellied polyacrylamide to Olyzias latipes was acute at 8,000 ppm depending on the pH of the jelly and not toxic at concentrations less than 4,000 ppm. The causal substance of fish toxicity was free ammonia liberated when the jelly was subjected to partial hydrolysis with caustic soda. At concentrations less than 500 ppm the growth inhibiting action of jellied polyacrylamide for Porphyra tenera was not observed. Growth inhibition was found at concentrations ranging 1,000-5,000 ppm. The cause was attributed to higher pH values. (Klein)
W76-02391

EFFECT OF DIFFERENT CONSTANT INCUBATION TEMPERATURES ON EGG SURVIVAL AND EMBRYONIC DEVELOPMENT IN LAKE WHITEFISH (COREGONUS CLUPEAFORMIS),
Bureau of Commercial Fisheries, Ann Arbor, Mich. Great Lakes Fishery Lab.
L. T. Brooke.
Transactions of the American Fisheries Society, No 3, p 555-559, 1975. 3 tab, 7 ref.

Descriptors: *Freshwater fish, *Temperature, *Water quality, Growth stages, Growth rates, Fish eggs, Embryonic growth stage, Equations, *Thermal pollution, Water pollution effects.
Identifiers: *Lake Whitefish, *Coregonus clupeaformis.

Eggs of lake whitefish (Coregonus clupeaformis) were incubated in a constant-flow incubator at constant temperatures of 0.5, 2.0, 4.0, 5.9, 7.8, 10.0C. The time for fertilization to median hatch was inversely related to temperature, and ranged from 41.7 days at 10.0 C to 182 days at 0.5C. The percentage hatch was highest at 4.0, 5.9, and 7.8C, and was greatly reduced at 0.5, 2.0, and 10.0C. The mortality of embryos was greatest during the early stages of development. Abnormally developed fry were most frequency at 10.0C and least frequent at 4.0C. Mean lengths of fry at hatching were shorter at 7.8 and 10.0C than at lower temperatures. The optimum temperature range for incubation of lake whitefish eggs was 3.2-8.1C. Equations were derived for predicting development time to 20 successive stages, and to hatching, at constant incubation temperatures and at fluctuating daily mean water temperatures. (Klein)

Identifiers: Crassostrea-Rhizophorae, Mangrove oyster, Venezuela.

Growth and mortality of the mangrove oyster (C. rhizophorae) cultivated by the hanging technique, was studied over a 10 mo. growth period. Spatfalls for Oct. and Dec. were compared. At 10 mo. of

age, oysters from both spatfalls appeared to reach an asymptotic length of approximately 7 cm. During the 1st 4 mo. of age, both groups grew equally. The Oct. spatfall grew slightly faster. The growth of oysters in Laguna La Restinga, Isla de Margarita, appeared to be similar to that in other areas of E. Venezuela. The instantaneous mortality coefficients were similar. Estimated survival for the Oct. and Dec. spatfalls were 11.21% and 9.1%, respectively.--Copyright 1975, Biological Abstracts, Inc.

SANITARY CHARACTERIZATION OF THE SERGEEVKA RESERVOIR, (IN RUSSIAN),
North Kazakhstan Regional Sanitary Epidemiological Station, Petropavlovsk-Kamchatskii (USSR).
E. A. Dik, and L. E. Petrovskii.
Gig Sanit. 7 p 90-91, 1974.

Descriptors: *Bacteria, *Coliforms, *Reservoirs, Rivers, Potable water, Water supply, Industrial water, *Water quality, Data collections, Pollutant identification.
Identifiers: Ishim River(USSR), Kazakh-SSR, Sergeevka, *USSR.

The Sergeevka reservoir is located on the Ishim River in the North Kazakhstan district of the Kazakh SSR (USSR), 1066 km from the mouth of the river near the city of Sergeevka. It is used for supplying potable and industrial water. Data is presented on the water quality of the Ishim River before stream-flow control in 1967 and in the reservoir in 1972: transparency, suspended matter, color, odor, pH, total hardness, chlorides, sulfates, solid residue, oxidizability, dissolved 02, biochemical 02 demand, coliform titer and F.--Copyright 1975, Biological Abstracts, Inc.

POTENTIAL ENVIRONMENTAL PROBLEMS OF DREDGING AND DREDGED MATERIAL DISPOSAL: DREDGED MATERIAL DISPOSAL CRITERIA,
Texas Univ. at Dallas, Richardson. Inst. for Environmental Sciences.
G. F. Lee.
In: Proceedings of the Pacific Coast Conference on Dredging, California Marine Affairs and Navigation Conference, February 10-21, 1975, San Francisco, Calif., p 62-68. (Preprint 18 p).

Descriptors: *Disposal, *Standards, *Dredging, *Water quality, Turbidity, Chemicals, Water pollution, Toxins, Pollutants, Sediments, Shellfish, Fish reproduction, Benthos.
Identifiers: *Dredge spoil, Elutriate test, San Francisco Bay.

Dredging and dredged material disposal may adversely affect water quality at dredging and disposal sites due to turbidity, mechanical effects of the operation and potentially toxic chemicals, however, available information suggests that adverse effects are rare. Dredged material disposal criteria based on bulk chemical analyses should not be used because they do not indicate the potential significance of chemical contaminants in sediments on water quality. It is recommended that the Elutriate test be used nationwide as criteria for dredged material disposal. Dredged material disposal should be prohibited in sensitive areas, such as fish-spawning or shellfish grounds. If there is potentially significant chemical contaminant release, the impact of this release on open water and on-land disposal techniques should be considered. A benthic organism bioassay test would evaluate the potential long-term adverse effects of chemical contaminants in dredged sediments on aquatic organisms. There is little evidence that chemical contaminants in sediments are adverse to aquatic ecosystems due to dredging or dredged material disposal. A comparison of the relative environmental impacts of on-land and nearshore diked area disposal with open water disposal may indicate that such alternate disposal methods may greatly increase dredging costs with little or no water quality improvement. (Buchanan-Davidson--Wisconsin)

THE PHYTOPLANKTON OF CANYON LAKE, ARIZONA,
Arizona State Univ., Tempe. Dept. of Botany and Microbiology.
M. R. Sommerfield, R. M. Cisneros, and R. D. Olsen.
Southwestern Naturalist, Vol 20, No 1, p 45-53, May 15, 1975. 1 fig, 1 tab, 11 ref

Descriptors: *Phytoplankton, *Cyanophyta, *Chrysophyta, *Euglenophyta, *Aquatic algae, Euglena, Aquatic microorganisms, *Arizona, Succession, Chlorophyta, Eutrophication, Aquatic microbiology, Water quality, Limnology.
Identifiers: *Canyon Lake(Ariz), Bacillariophyceae, Dinophyceae.

Data were obtained on phytoplankton composition and their seasonal dynamics in Canyon Lake, located about 50 miles northeast of Phoenix, Arizona. From March, 1971 through February, 1972, over 100 species were identified as belonging to the following classes: Chlorophyceae 42 species, Bacillariophyceae 46 species, Cyanophyceae 8 species, Chrysophyceae 3 species, Euglenophyceae 4 species, and Dinophyceae 2 species. A majority of the organisms were found in small numbers, whereas a few reached bloom proportions. A well-defined succession was observed with each class of algae showing some periodicity. The lack of previous data on other central Arizona lakes is indicated by the more than 50 species found which have not been previously recorded in the state. The largest phytoplankton populations were recorded in February-March and August-September. (Robinett-Arizona)

EFFECT OF AMMONIUM LIGNOSULFONATE ON SOIL MICROORGANISMS (O VLIYANII LIGNOSUL'FONATA AMMONIYA NA POCHVENNYE MIKROORGANIZMY),
Akademiya Nauk SSSR, Moscow. Institut Agrokhimii i Pochvovedeniya.
T. P. Malygina, L. V. Evtikova, and E. V. Vasil'ev.
Pochvovedenie, No 3, p 73-76, 1974. 1 illus, 6 ref, 1 tab. English Summary.

Descriptors: *Lignins, *Soil microorganisms, *Sulfite liquors, *Pulp wastes, Industrial wastes, Wastes, Toxicity, Chemical wastes, Water pollution sources, Toxins, Soil bacteria, Bacteria, Azotobacter, Electrodialysis, Calcium hydroxide, Cobalt, Salts, Waste disposal, Ammonium salts, Flood plains, Soil disposal fields, Ultimate disposal.
Identifiers: *Lignosulfonates, Azotobacter chroococcum, Don River(USSR), Soviet Union(USSR), Spent sulfite liquor, Spent pulping liquors.

In connection with the use of lignosulfonates (such as found in spent sulfite pulp liquors) as soil conditioners, a study was made of their effects on soil microflora. Laboratory tests were conducted with Azotobacter chroococcum and the following preparations: technical ammonium lignosulfonates (containing organic and acidic mineral impurities), and three high-molecular preparations obtained by treatment of the technical lignosulfonates with calcium hydroxide, with a complex cobalt salt, and by electrodialysis. The concentration of the lignosulfonate in the nutrient medium was 0.1-1.5%. The high-molecular fraction separated by electrodialysis was the least toxic: there was a good growth of the bacteria at a concentration of 1%. At the same concentration, the technical lignosulfonate was inhibitory. It is suggested that the toxic action is due to the acidic admixtures [illegible] the technical lignosulfonate. Field experiments with the technical lignosulfonate were conducted on soils of the lower Don River floodplains. When introduced into the soils in an amount of 1 t/ha, technical lignosulfonate had a stimulating action on soil microorganisms, as determined by plate counts (Stapinski-IPC)

5D. Waste Treatment Processes

ELECTROLYTIC TREATMENT OF JOB SHOP METAL FINISHING WASTEWATER,
New England Plating Co., Inc., Worcester, Mass.
B. E. Warner
Available from the National Technical Information Service, Springfield, Va 22161. Environmental Protection Agency, Report EPA-600/2-75-0[illegible] September 1975. 151 p, 26 fig, 19 tab. EPA 1BB036,ROAP 21AZ0,Task 15 ;2010 GUG

Descriptors: Chlorination, *Industrial wastes, *Waste water treatment, *Electrolysis, Chromium, Oxidation
Identifiers: *Electrochemical treatment, Chemical treatment, Semi-conductive bed electrolysis, *Chromium reduction, *Cyanide oxidation.

Full scale in-plant production studies demonstrated the reliability and economics of electrolytic cells containing beds of conductive particles between cathodes and anodes for reduction of hexavalent chromium and oxidation of cyanide in plating rinse water. The heavy metals are subsequently removed from the waste water by alkaline precipitation. Seventy-five liter/min. (2- GPM) sized cells were employed for chromium and cyanide rinses. Chromium concentrations to 2[illegible] mg/liter and cyanide concentrations to 150 mg/liter were processed. Data were obtained with parallel equipment using chemical treatment for cost comparison. At low chromium concentrations (less than 25 mg/liter), chemical reduction was more economical. At higher concentrations ([illegible] mg/liter), electrolytic reduction became the more economical process. In cyanide oxidation, the electrochemical process reduced direct costs associated with chlorination. Waste treatment costs, capital and operating, for the job shop are provided with an assessment of total costs on the price of services provided. Water conservation techniques are described. Experience with tube settling equipment for removal of suspended solids and centrifuge for sludge concentration is provided. (EPA)

TRENCH INCORPORATION OF SEWAGE SLUDGE IN MARGINAL AGRICULTURAL LAND,
Agricultural Research Service, Beltsville, Md. Biological Waste Management Lab.
J. M. Walker, W. D. Burge, R. L. Chaney, E. Epstein, and J. D. Menzies.
Available from the National Technical Information Service, Springfield, Va 22161. Environmental Protection Agency, Report EPA-600/2-75-03[illegible] September 1975. 231 p, 58 fig, 69 tab, append. EPA 1BB043 (ROAP 21-ASE, Task 027). 68-01-0162.

Descriptors: *Sludge disposal, Metals, *Sewage sludge, Land reclamation, Waste disposal, *Trenches, *Waste treatment, Salmonella, Limes, Coliform bacteria.
Identifiers: Limed raw sludge, Digested sludge.

A trench method was tested for transporting and placing digested and limed raw (undigested) sewage sludges (8% and 20% solids) in trenches in study soil at loadings up to 1150 dry tons/hectare (500 dry tons/acre) without odor problems or hazard of surface runoff. Field scale trenching was best achieved by digging the trenches on contour not more than 75 cm deep, 60 cm wide, and from

LIBRARY U. OF I. URBANA-CHAMPAIGN

75 cm apart. The study indicated that the best e transport method would employ concrete · trucks. Trenches could then be filled dly from discharge chutes or indirectly with a altic pump. A tracked trenching machine a maneuverable rear-mounted digging wheel , new trench and simultaneously backfilled a el sludged trench. In 2 years, neither heavy ls nor pollution indicator organisms (coliform almonella) have moved more than about 30 om entrenched sludge into surrounding soil. rate amounts of nitrate nitrogen have moved underdrainage water but not into the un- ound aquifer. The lime in the sludge reduced l movement into soil and availability to crops netal uptake was modest. Tested agricultural ices included cross ripping, tilling, and ping, with grasses recommended for the first Entrenchment appeared feasible for sludge sal and improving marginal land. (EPA)

EATMENT OF COMBINED SEWER OVER- OWS BY DISSOLVED AIR FLOTATION,
ineering-Science, Inc., Berkeley, Calif.
. Bursztynsky, D. L. Feuerstein, W. O. ddaus, and C. H. Huang.
ilable from the National Technical Informa- Service, Springfield, Va 22161. Environmen- Protection Agency, Report EPA-600/2-75-033, tember 1975. 213 p, 54 fig, 42 tab, 16 ref, 6 ap- d. EPA 1BB034. WPRO-258-01-68.

criptors: *Combined sewers, *Flotation, ign, Overflows, *Waste water treatment, Pilot nts, Suspended solids, *Operating costs, ifornia, Runoff, Treatment facilities, Storm ru- f, Storm water.
ntifiers: *Dissolved air flotation, *Combined er overflow, San Francisco(Calif).

s program investigated the use of dissolved air ation for the treatment of combined sewer rflows. A 24-mgd prototype facility was con- cted and evaluated. The most recent study se demonstrated the performance charac- stics of the prototype Baker Street dissolved flotation facility for the treatment of combined er overflows under a broad range of operating ditions. Summary data from initial studies in program using a pilot plant and the prototype ility with dry-weather flow are compared with the recent results. Improvements are suggested in the design and operation of dissolved air flotation facilities. Under several specific test conditions the Baker Street facilitity effected reductions in comgined sewage constituents which resulted in an effluent quality meeting some local discharge requirements. Difficulties were encountered with alum floc carry-over into the effluent. Wastewater pollutant removals were highest--51 percent suspended solids from an influent of 99.5 mg/l and 82 percent BOD from an influent of 32.1 mg/l, measured in Test No. 8--at surface loading rates of 145 m3/(m)2 (day) (3,580 gal/ (ft)2(day)), an alum dosage of 75 mg/l, and a minimum air to solids ratio of 0.05 kg air/kg solids. Specific design modifications are recommended for investigation to determine their effect on system performance of the Baker Street facility. The construction cost for the 24-mgd Baker Street facility with architectural treatment was $2,518,000, adjusted to an ENR index of 2240. Annual O and M costs are calculated to be $17,200. (EPA)

AEROBIC STABILIZATION OF WASTE ACTIVATED SLUDGE - AN EXPERIMENTAL INVESTIGATION,
Metropolitan Denver Sewage Disposal District No 1, Commerce City, Colo.
D. B. Cohen, and D. G. Fullerton.
Available from the National Technical Information Service, Springfield, Va 22161. Environmental Protection Agency, Report EPA-600/2-75-035, September 1975. 174 p, 62 fig, 47 tab, 17 ref, append. EPA 1BB043 (ROAP 21ASD, Task 17). 68-03-0152.

Descriptors: *Biodegradation, *Activated sludge, *Aerobic conditions, *Oxygenation, Respiration, Odor, Biochemical oxygen demand, Metalbolism, Biomass, *Design criteria, Hygiene, Aerobic bacteria, Flotation, *Sludge digestion, Filtration, *Waste water treatment.
Identifiers: Biodegradable solids destruction, Odor reduction, Pathogenic organisms elimination, Denver(Colo).

Metro Denver Sewage Disposal District No 1 (Metro) in 1970 converted excess secondary aerators to aerobic digestors. The plant scale diffused air system was compared with a pilot scale open tank oxygen system using very fine bubble fixed and rotating diffusers. For the air system volatile suspended solids (VSS) reductions ranged between 11.2% and 47.2%. A significant correlation was observed between VSS reduction and detention time-temperature factor. Cold shock eliminated nitrification for a five month period. When invertebrates, particularly rotifers, comprised a significant fraction of the biomass, digestion was maximal. The pollutant concentration in the supernatant from the aerobic digestor averaged 10% of that from an anaerobic digester. For the oxygen batch tests, biodegradable VSS digestion rate coefficient k averaged 0.27. No correlation was observed between DO concentration and VSS reduction rates. The temperature of the oxygen digested biomass increased with increased loadings. At loadings greater than 2.25 kg VSS/m3/day (0.14 lb VSS/ft3/day), oxygen performance was superior to the diffused air system. Loadings as high as 9.6 kg VSS/m3/day (0.60 lb VSS/ft3/day) were successfully employed with the rotating diffuser oxygen system. To continue the aerobic digestion economic benefits of reduced sludged disposal costs, Metro is considering conversion of a 3,785 cubic meter (1 million gallon) sludge holding tank to an oxygen digester. (EPA)

INFILTRATION--INFLOW ANALYSIS,
National Environmental Research Center, Cincinnati, Ohio. Advanced Waste Treatment Research Lab.
D. J. Cesareo, and R. Field.
Journal of the Environmental Engineering Division, Proceedings of ASCE, Vol 101, No EE5, p 775-785, October, 1975.

Descriptors: *Infiltration, *Inflow, *Cost analysis, *Sewers, Rehabilitation, Treatment facilities, Construction costs, Simulation analysis, Waste water treatment, Evaluation.
Identifiers: *Infiltration/inflow analysis(i/i).

Excessive infiltration/inflow (i/i) from runoff has been defined as the quantities of i/i that can be economically eliminated from a sewer system by rehabilitation. This value is determined by a cost-effectiveness analysis in which the costs of correcting the infiltration/inflow conditions are compared with the costs of increasing the treatment works capacity to provide proper treatment of the i/i quantities. Countermeasures against infiltration and inflow involve either the prevention of excessive extraneous flows or the correction of conditions already imposed on existing sewer systems. A cost-effectiveness evaluation of a surcharged sewer system and overloaded waste water treatment facility should consider at least: increased size and cost of new sewers if i/i is permitted; need for construction of relief or supplementary collection and interceptor sewers; operation and maintenance costs for handling sewer surcharges, clean up of flooded areas and damages to flooded private properties; costs of repairing pavement cave-ins or washouts of subsurface utilities caused by infiltration and exfiltration; costs of removing soil, debris, and tree roots entering sewers through defective sewer pipes and joints; increased costs at waste water treatment facilities; and future elimination of bypassing untreated flows from sewers. The five phases of a sewer system evaluation survey were outlined as: physical survey; rainfall simulation; preparatory cleaning; internal inspection; and survey report. A hypothetical infiltration/inflow cost evaluation was presented, and costs for an infiltration reduction program in Locust Grove, Oklahoma, and an inflow reduction program at Springfield, Illinois, were detailed. LARGE DIAMETER SEWER AVERAGES $234.50 PER LIN FT.
Engineering News Record, Vol 195, No 18, p 35, October 30, 1975. 1 tab.

Descriptors: *Costs, *Sewers, Concrete, Engineering, Tunnels, Manholes, Construction materials, District of Columbia.
Identifiers: Gravity sewers, Washington(DC).

The lowest prices for 5220 linear ft of 102-in diameter reinforced concrete gravity sewer averaged $234.50 per linear ft in a competition

among 13 contractors for a suburban Washington, D.C. sanitary sewer project. The contract was taken for $2,596,944, 22% below the original engineering estimate, and 13.4% below the second lowest bidder. A 102-in diameter pipe and 920 linear ft of 72-in diameter concrete sewer pipe will be installed in trenches as deep as 22 ft that will parallel the Anacostia River. Project work will include building 150-in diameter steel lined tunnels to carry a 270-ft long section of pipe under a highway and another section 35 ft deep under railroad tracks. Additionally, a 24-ft deep manhole will be built to connect the 102-in diameter pipe to an existing line. Data are provided on the prices of various construction materials for the project. FILTER-PRESS FOR DRYING WASTE AND SEWAGE SLUDGES.
French Patent FR 2242-133, Issued May 2, 1975, Derwent French Patents Abstracts, Vol W, No 23, p D3, July 1975.

Descriptors: *Filters, *Dewatering, *Waste water treatment, *Patents, *Sewage treatment, Equipment, Sludge treatment.
Identifiers: *Filter presses.

A patent was issued forca filter press which dewaters waste water and sewage sludges. The press consists of two endless filtering bands which are guided around a roller assembly to follow concentric trajectories, one on the inside and the other around a common arc. The sludge to be treated is pumped into a mixer where it is flocculated; the mixture then passes through a reaction chamber which provided with a wide overflow. Sludge is pressed between the two bands by the pressure of adjustable rollers. The water is squeezed out and this is collected by metallic plates. The system is very compact, and the sludge is treated in successive stages for an increased drying effect. (Kramer-FIRL)

AERATING PROPELLOR FOR BIOLOGICAL PURIFICATION OF WASTE WATER.
Netherlands Patent NL 7416-582. Issued July 25, 1975. Derwent Netherlands Patents Abstracts, Vol W, No 32, p D1, September 1975.

Descriptors: *Patents, *Aeration, *Biological treatment, *Waste water treatment, Liquid wastes, Organic matter.
Identifiers: *Aerators, Propellors.

A patented aerating propellor for the biological treatment of waste water is described. This power driven, high speed rotary propellor is mounted on the end of a hollow shaft. An air inlet above the surface of the liquid in which the propellor is immersed induces vigorous aeration of the liquid via an air outlet at the end of the shaft. The propellor has at least one helical blade extending around at least two-thirds of the circumference of the shaft. Polluted liquid is vigorously areated to improve biological purification by increasing the bacterial action to oxidize dissolved organic matter. A compact and powerful jet is directed axially from the propellor and will disperse dead pockets, prevent sedimentation, and avoid stagnation. Because the aerating efficiency is higher than with conventional agitators, reduced power requirements and low blade stresses are found. (Kramer-FIRL)

PRESSURE SEWER SYSTEM,
Equipment/One Corp., Schenectady, N.Y. (assignee).
R. P. Farrell, Jr., R. C. Grace, and W. J. Doyle.
United States Patent 3,904,131. Issued September 9, 1975, Vol 938, No 2, p 643, September 1975. 1 fig.

Descriptors: *Patents, *Sewers, *Sewerage, *Waste water treatment, *Sewage treatment, Liquid wastes, Pumps.
Identifiers: *Pressure sewers.

A patent has been issued for a pressure sewer system. This sewage transport system includes a combination of several sewage generating sites, each of which includes at least one collection tank. A grinder is arranged so that the liquid sewage is suctioned from the tank and ground liquid slurry sewage is discharged from its outlet. A pump has its inlet connected to the outlet of the grinder and provides a significant discharge flow of ground liquid slurry sewage under pressure from its outlet. Outlet check valves within the discharge passage permit liquid sewage to flow only to the direction from the outlet of the pump to a receiving point and prevent backflow of pressurized liquid sewage. (Kramer-FIRL)
W76-02181

BIOLOGICAL PURIFICATION OF WASTE WATER AND SEWAGE.
French Patent FR 2238-675. Issued March 28, 1975. Derwent French Patents Abstracts, Vol W, No 19, p D3, June 1975.

Descriptors: *Patents, *Biological treatment, *Bacteria, *Algae, Nitrogen, Phosphorus, Nutrient removal, Biochemical oxygen demand, *Waste water treatment, Equipment.
Identifiers: Symbiosis.

A system of biological purification of waste water and sewage has been patented which involves algal and bacterial symbiosis. The conventional activated sludge process reduces the BOD but only has a slight effect on nitrogen and phosphorus levels. This new process results in a more rapid reduction of the BOD and COD; it also reduces nitrogen, phosphorus, and pathogenic germs. Water is fed into a tank and is illuminated by appropriately placed lamps. Automatic stirring takes place. Unicellular algae and bacteria, naturally present in the water to be treated, grow considerably in the illuminated medium. Bacteria, using the oxygen supplied by the algae, degrade the organic matter and liberate carbon dioxide. Mineral matter is assimilated by the algae. Water is pumped to a pressurized enclosure equipped with candle filters and the filtered water is collected. Secondary or tertiary treatment may also be effected in the same tank and the algal material can be collected and reused. (Kramer-FIRL)
W76-02182

ACTIVATED SLUDGE TREATMENT TANK WITH CHEMICAL AERATOR.
German Patent DS 2324-678. Issued July 31, 1975. Derwent German Patent Abstracts, Vol W, No 32, p D1, September 1975.

Descriptors: *Patents, *Activated sludge, *Aeration, *Clarification, Biological treatment, *Waste water treatment, Separation techniques, Equipment.
Identifiers: Aerators, After clarification chamber(ACC).

A patent has been granted for an activated sl treatment tank with a central aerator. On several pipe lines are provided in addition to lines connected to a standpipe. These are adj ble in height and end in the region of the water face of the after clarification chamber (ACC). additional pipe lines terminate in a shaft arra outside of a circular basin. The shaft is structed to allow the waste water flowing thr enough time to separate out the floating sludg the water surface and to prevent a short circu of the flow between the two pipe lines. The sh equipped with an overflow weir adjustabl height, located before the mouth of the pipe ending in the region of the water surface of ACC. A regular withdrawal of excess floc sludge from the ACC is possible, maintaining control over this removal process. (Kramer-FI

THICKENING ACTIVATED SLUDGE FR EFFLUENT TREATMENT PLANTS.
Netherlands Patent NL 7316-640. Issued Jun 1975. Derwent Netherlands Patents Abstracts, W, No. 25, p D1, July 1975.

Descriptors: *Patents, *Dewatering, *Waste w treatment, *Sludge treatment, Activated slu Biological treatment, Recycling, Treatment fa ties.
Identifiers: *Sludge thickening.

A method for thickening activated sludge f biological treatment plants has been patented. concentration of sludge discharged from an fluent purification plant may be increased by lowing the flocs of sludge to settle in a reservo the presence of heavy particles introduced into liquid. The settled material is supplied to at l one hydro-cyclone in which the sludge flocs separated from the heavy particles which are r cled to the reservoir. Sludges which settle with difficulty and/or very slowly may thickened with this system and will achieve centrations suitable for centrifugation. Th heavy particles have a high specific gravity r tive to the sludge flocs and a particle size of 1 100 microns. They may consist of magnetite, rosilicon, or suitable types of sand or loess. concentration of heavy particles used to ent the sludge should be less than 25 g/liter. (Kra FIRL)

riptors: *Waste water disposal, *Municipal es, Irrigation, Groundwater, Irrigation, Land Design criteria, Environmental effects, Waste ment, Water reuse.
ifiers: Effluent loading, Land treatment, ndwater mound.

e second of two papers prepared on design rs for land treatment of municipal waste effluents, a review of land application esses and factors influencing the identifica- and selection of land application sites is nted. Effluent loading constraints, effluent ng design and the operation of alternative application systems are detailed. An emphasis placed on the design of a suitable loading rate he requirements for drainage, field investiga- , monitoring systems, crop selection, irriga- schedules, and farm management. An exam- f the selection process was graphically illus- d for Colorado, involving location, land ability and costs, environmental impacts, ng capacity, and water rights. Impacts on ndwater of the high rate irrigation process and nfiltration/percolation were compared. Ef- t loading constraints--climatic, infiltration, lation, nutrient removal, ss, BOD, COD, and anics--were discussed. In designing a suitable lexible loading rate, the goal should be rela- constant movement through soil, avoiding sired seasonal load. It was recommended that cation be increased during the peak of the otranspirational period. In systems using an tion method for land treatment, the ground- mound must be taken into account. As this nd builds up over time, the loading rate must ecreased to postpone the need for drainage. mer-FIRL)

FACE AERATORS FOR EFFLUENT ATMENT.
eyor, Vol 146, No 4344, p 56, September 12,

riptors: *Aeration, *Sewage treatment, ste water treatment, Installation, Treatment ties, Effluents, Dissolved oxygen, Models, ons.
ifiers: *Aqua-lator surface aerators.

ing Aqua-lator surface aerators have been loped for the treatment of sewage and indus- effluents prior to discharge. These were gned for installation in a lagoon or river, or in a tank at a treatment works. The aerators work efficiently when distributed at progressively increasing distance so that each aerator receives effluent from the previous one when the dissolved oxygen level drops to about one mg/liter. Two basic types of Aqua-lator aerators are series FLTM, with ratings of up to 20 hp, comprising a glassfiber floating unit supporting an axial pump; and series 400, covering ratings of up to 75 hp. These models are based on the same principle but the series 400 models were designed to follow special hydraulic optimization. Both types of Aqua-lator aerators can be equipped with anti-swirling devices. Other options include a draft tube for deep tank operation and an antierosion device for very shallow lagoons. MUNICIPAL WASTEWATER REUSE IN THE U.S.,
SCS Engineers, Long Beach, Calif.
C. J. Schmidt, I. Kugelman, and E. V. Clements, III.
Journal Water Pollution Control Federation, Vol 47, No 9, p 2229-2245, September 1975, 18 tab, 2 ref.

Descriptors: *Water reuse, *Municipal wastes, *Recycling, Irrigation, Groundwater, Water pollution control, Groundwater resources, Municipal water, Waste water treatment, Lakes, Cooling water.
Identifiers: *Waste water reuse, Industrial reuse.

A state-of-the-art survey was compiled on existing municipal waste water reuse systems. The examples provided emphasize direct reuse of the water as it leaves the treatment plant. Data were organized into the categories of: irrigation and other agricultural uses, cooling water, industrial process water, boiler feed water, recreational lakes, fish propagation, and nonpotable domestic use. Operations for 358 sites in the United States were studied. Of these locations, about 95% were in the semi-arid southwest states of Texas, California, Arizona, New Mexico, Colorado, and Nevada. Total reuse volume was 133 bil gal, exclusive of groundwater recharge. About one quarter of the plants furnishing waste water for irrigation in 1972 provided only primary treatment. While many irrigation systems were intended as disposal methods, there has been increased concern that pollution and infiltration may have an adverse effect on groundwater resources. Only 14 industrial plants now use municipal waste water, and potential industrial reuse opportunities have not been recognized. Treated municipal waste water has been used for cooling water makeup at 12 facilities. This is probably the most underdeveloped reuse potential of such waste waters. Three California municipal treatment plants now provide treated effluent for major lake recreational projects; these are successfully providing high quality effluent, and pose no health hazards. Overall, only a small percentage of municipal waste water is reused in this country, and continued development of reclamation programs is recommended. (Kramer-FIRL)

WASTE WATER AERATION WITH OXYGEN (ABWASSERBELUEFTUNG MIT SAUERSTOFF),
F. Karnovsky.
Abwassertechnik, Vol 26, No 3, p 18-20, 1975. 6 fig.

Descriptors: *Waste water treatment, *Aeration, *Oxygen, Sludge treatment, Biological treatment, Oxygenation.
Identifiers: UNOX process.

Methods and equipment for the aeration of waste water with technical-grade oxygen rather than with air, as developed by Union Carbide, Airco, Ames Crosta, and Linde AG, are described. The UNOX system developed by Union Carbide uses series-connected closed aerator tanks into which oxygen is admitted through perforated pipes. The Airco System uses tubular reactor for the oxygenation of waste water mixed with oxygen-enriched activated sludge and return sludge. A combination of a first biological stage with oxygen and a second flotation stage using air was used experimentally in France. Compared with conventional aeration, oxygenation offers an increased oxygen content in the waste water, increased sludge concentration, and consequently an increased purification efficiency at a slightly increased operating cost. (Takacs-FIRL)
W76-02190

FLOW EQUALIZATION--PLUS FOR WASTEWATER TREATMENT PLANTS.
Civil Engineering--ASCE, Vol 45, No 9, p 66-68, September 1975, 2 fig, 1 tab.

Descriptors: *Flow rates, *Waste water treatment, *Treatment facilities, Retention, Effluents, Design criteria, Economics.
Identifiers: *Flow equalization, *Retention basins, Peak flows.

Flow equalization for waste water treatment processes is discussed, particularly the achievement of equalization by building retention basins at the treatment site. Advantages of a 'steady-state' waste water treatment process are the potential for better biological and chemical actions, resulting in improved effluent; design economies with the elimination of peak flows; power savings; and operation reliability. Two EPA projects in Michigan were investigated in detail. One at Ypsilanti uses an in-line retention basin where all flow is passed through the basin and the other, at Walled Lake, uses a side-line basin where only excess flows are diverted. One reason that more plants have not used retention basins is that traditional plant design includes oversize clarifiers. Because of EPA effluent standards, plants must now be designed for peak flows. Proponents of flow equalization believe that design should return to average flow criteria. The cost effectiveness advantage of flow equalization rather than overdesigning has not been resolved. Besides regulatory agency restrictions, cost decision on flow equalization will depend upon individual factors for a given plant, such as size of facility, flow variations, quality of influent, desired quality of effluent, and site considerations. (Kramer-FIRL)
W76-02191

DIFFERENT AERATION SYSTEMS FOR GROUNDWATER AND SURFACE WATER (VERSCHIEDENE SYSTEME ZUR BELUEFTUNG VON GRUNDUND OBERFLAECHENWASSER),
B. Moergeli, and J. Ginocchi.
Chemie-Technik, Vol 4, No 5, p 175-178, 1975, 9 fig, 13 ref.

Descriptors: *Groundwater, *Surface waters, *Aeration, *Water treatment, *Waste water treatment, Biological treatment, Equipment.
Identifiers: Aerators.

Different types of aeration systems for groundwater and surface water are described and compared. Open aeration systems such as atomizers, ring aerators, and corrugated foil type aerators have diffusion coefficients of 150/hr, 50/hr, and 170/hr, as well as surface loads of 250 cu m/sq m per hr to 800 cu m/sq m per hr, respectively. Closed aerating systems are bubbling aerators or surface aerators, such as roller and gyro type aerators, or aerators with submerged pumps. Surface aerators are used when the water to be aerated has sufficient flow speed. The closed type Sulzer aerator, consisting of a cylinder providing for intense mixing of the two phases and for continuous renewal of the phase boundary, proved to be most efficient of all aerators investigated. It adopts the static system and parallel flow of water and com-

pressed air. It ensures a diffusion coefficient of 170/hr and surface loads of up to 1,000 cu m/sq m per hr. (Takacs-FIRL)

SEWAGE DISPOSAL PLANT WITH AUTOMATIC CONTROL SYSTEM.
Hokushin News, Vol 18, No 1, p 4-12, May, 1975, 10 fig, 5 tab.

Descriptors: *Sewage disposal, *Waste water treatment, *Control systems, *Automation, Flow meters, Aeration, Biological treatment, Water treatment, Filtration, Chemical precipitation, Ozone, Ion exchange, Activated carbon.

A general discussion was presented on a control system for waste water treatment. Control of inflow waste water was done by an electromagnetic flow meter and a P-B flume was used for outflow water. Sludge at the bottom of the initial sedimentation basin was removed periodically, particularly when it reached a high concentration (1-1.5%). An ultra-sonic damping device was used to give signals to stop the removal when the sludge concentration was too low. The flow rate of inlet air to the aeration tank was usually proportional to the flow rate of inflow waste water and the ratio was determined by dissolved oxygen, BOD, and suspended solids. Sludge was usually digested at about 35 degrees C and the heating was accomplished by passing hot water at about 55 degrees C or by directly introducing steam. The fermentation temperature was controlled by a platinum-resistance type meter. A three-phase treatment method was applied for water treatment by using, microfiltration, coagulation-precipitation, high speed filtering with sand, ozone oxidation, ion exchange, and activated carbon. ARTIFICIAL GROUNDWATER RECHARGE AND WASTEWATER RECLAMATION,
Suffolk County Dept. of Health, N.Y.
J. J. Baffa.
Journal of the American Water Works Association, Vol 67, No 9, p 471-476, September, 1975, 8 fig, 5 ref.

Descriptors: *Recharge, *Groundwater, *Recycling, Water supply, Conservation, Economics, Injection wells, Municipal wastes, Water reuse.
Identifiers: *Artificial groundwater recharge, Groundwater management.

Economic, conservation, and research factors pertinent to artificial groundwater recharge and waste water reclamation were discussed. Artificial recharge of aquifers has been used successfully for groundwater management in preventing losses to stream flow. Research has been conducted on hydraulic aspects, particularly on how to most efficiently use the soil and recharge water interface to allow maximum rates of transfer of recharge water to the aquifer. The capability of these systems to remove nitrogen from waste waters has been of considerable interest. A pilot plant shallow well injection system was tested. Effluent from a municipal single-stage trickling filter plant was injected through wells, which were then used for water quality sampling. After a three-year period, water quality parameters were separated into two categories: those of a soluble stable mineral character such as chlorides and alkalinity; and those with latent biological propensities such as nitrogen compounds, sulfates, phosphates, carbon dioxide, and organic solids. Concentrations found were affected by the amount of water recharged, the amount of natural groundwater flow (which causes dilution), changes in aquifer permeability from clogging, and biochemical effects of bacterial action. It was concluded that for all water quality parameters, adsorption and dilution were important factors. To reduce soil clogging and to prevent release of unwanted nitrogenous compounds, it was suggested that organics and nutrients be removed by tertiary treatment, particularly when the objective of artificial recharge is municipal water supply. COLLECTION AND PURIFICATION OF WASTEWATERS (AUFFANGEN UND REINIGEN VON ABWAESSERN).
Kunstotosffberater, Vol 20, No 8, p 390, August 1975.

Descriptors: *Runoff, *Storm water, Pollution identification, Chemical industry, *Waste water treatment, Water discharge, Treatment facilities.
Identifiers: *Collection basins.

The uncontrolled runoff of chemically contaminated storm water near a chemical plant in southern England made it necessary to build an 11 million liter-capacity collection basin measuring 107 m x 38 m at a maximum depth of 7.5 m. The bottom of the basin was tightly sealed by means of Hypalon, a weather-proof chemical-resistant synthetic rubber soil manufactured by Burke Rubber Company, San Jose, California. The black foil is 0.76 mm thick, and is composed of two Hypalon layers and an interposed nylon layer. The guaranteed service life of the foil is 20 yr. The contaminated storm runoff collected in the basin is pumped over to a treatment unit before being discharged into a river. (Takacs-FIRL)

METHOD AND APPARATUS FOR THE PURIFICATION OF AQUEOUS EFFLUENT,
J. R. Kaelin.
United States Patent 3,910,838, Issued October 7, 1975. Official Gazette of the United States Patent Office, Vol 939, No 1, p 340, October, 1975, 1 fig.

Descriptors: *Patents, *Aeration, *Oxygen, *Waste water treatment, *Liquid wastes, Equipment, Effluents, Tanks, Mixing, Tanks.

A patented method for treating liquid wastes has been described. Effluents are conducted directly into one end of a closed tank. This tank is located within a residence tank of larger capacity. Oxygen or an oxygen mixture is supplied to the effluent as it is conducted into the mixing tank. This oxygenated liquid is then passed through an exte flow path within the mixing tank, increasing reaction between the oxygen and the effluent. oxygenated waste is then discharged from other end of the mixing tank into the resid tank through several conduits. These conduit arranged near the floor of the residence tank oriented so that a strong rotary flow is produc this region, avoiding the formation of sl deposits. Part of the oxygenated effluent is cled back into the mixing tank, and excess ygenated effluent is removed from the resid tank. (Kramer-FIRL)

SEPTIC TANK TEE,
E. J. Maroschak.
United States Patent 3,904,228, Issued Septe 9, 1975. Official Gazette of the United St Patent Office, Vol 938, No 2, p 676, Septem 1975, 1 fig.

Descriptors: *Septic tanks, *Patents, *Sew disposal, *Waste disposal, Equipment, W water treatment.
Identifiers: *Septic tank tee.

A septic tank tee adapted for use with a septic was patented. It is formed of plastic, and ha elongate tubular body with open opposite ends a relatively short tubular branch member, with open opposite ends. One end of the br member is secured to the body member betw its ends and perpendicular to it. The bra member carries a split collar to aid in ancho the tee in operative position to the septic tan operative position the tee's body member wi upright within the tank and its branch member extend through an opening in the tank's side The end of the split collar closest to the b member will extend out from the branch mem and will engage the septic tank's outer wall. split collar has an outer circumferential extent responding to the outer circumference of branch member which carries it, and it is sec to the branch member. SURFACE VENTILATION ROTOR,
J. R. Kaelin.
Canadian Patent 972, 485, Issued August 5, 1 Patent Office Record, Vol 103, No 31, p 85-86, gust, 1975.

Descriptors: *Patents, *Aeration, *Oxyg *Waste water treatment, Equipment, Mixing.
Identifiers: Surface aeration rotor.

A survey aeration rotor has been patented for ding oxygen or an oxygen mixture into wa water to be clarified. Equipment includes at l two annular blade sets, an inner blade set and outer blade set, each including several bla These define the outer and inner fluid chann The sets are concentric and a dividing wal located between the blade sets. The innerm channels are curved within vertical planes so the waste water entering the inner channels fr below is deflected within these channels though angular displacement of about 90 degrees. Wa water than emerges from the periphery of the ro in an almost horizontal direction. The outer ch nels are inclined vertically upward and radia outward; waste water entering these outer ch nels from below is conducted so that it emer from the periphery of the rotor in paths which tersect the horizontal exit paths of the inner ch nels. Thus, intensive mixing of the waste water iting from the fluid channels takes place. (Kram FIRL)

HOD AND APPARATUS FOR CESSING REFUSE, SEWAGE AND/OR TE MATERIAL INTO A SOURCE OF RGY,
ckman, J. V. McKeever, H. F. Ferguson, and
Sotak.
ed States Patent 3,910,775, Issued October 7,
Official Gazette of the United States Patent
e, Vol 939, No 1, p 323, October, 1975, 1 fig.

Descriptors: *Patents, *Dewatering, *Waste disposal, Recycling, Fuels, Sewage *Waste water treatment, Filtration, Equipment, Suspended solids.
Identifiers: *Refuse.

A system has been patented for the processing of refuse and sewage into a stable fuel material. Collected heterogeneous refuse is collected, and ferro-magnetic objects are separated out. The collected refuse is then shredded; waste is added; and the mixture is compressed, dewatered, and fed to a filtration system. Raw sewage is passed through the filter bed where solids, matter in suspension, and precipitates are filtered from the raw sewage by filter briquettes. Expended filter briquettes are removed from the filter bed, and these are dewatered and made into pellets. Waste is than mixed with the pellets, and the entire mixture is again compressed, dewatered and briquetted into a form of fuel. (Kramer-FIRL)
W76-02214

PLANT FOR WASTEWATER TREATMENT,
FMC Corp., San Jose, Calif.
Q. L. Hampton, and E. J. Matras.
Canadian Patent 974,336, Issued September 9, 1975. Patent Office Record, Vol 103, No 36, p 74, September, 1975.

Descriptors: *Patents, *Waste water treatment, *Tanks, *Aeration, Sludge treatment, Separation techniques, *Treatment facilities, Biological treatment, Equipment.
Identifiers: Modular settling tanks.

A patent has been issued for a waste water treatment facility. Equipment is provided for converting a basic unitary tank structure into a series of communication treatment zones. This is achieved by introducing a self-supporting modular settling tank with liquid fillable fillets as part of the structure. Thus the member may be anchored in position, providing watertight tank member segments which operate as cooperative treatment zones. The modular tank member provides the basic support structure for the aeration system required to convert an adjacent tank segment into an aeration zone. It also effects the removal of sludge separated in the modular tank member from mixed liquor received from the aeration zone. Therefore, part of the sludge can be returned to the aeration tank and the remainder discharged to any additional treatment zones. (Kramer-FIRL)
W76-02215

MINI SEWAGE TREATMENT SYSTEM,
D. H. Call, E. L. Atwood, J. A. Cary, and J. D. Surette.
United States Patent 3,914,173, Issued October 21, 1975. Official Gazette of the United States Patent Office, Vol 939, No 3, p 1461, October, 1975, 1 fig.

Descriptors: *Patents, *Waste water treatment, *Irradiation, *Biological treatment, *Sewage treatment, Sedimentation, Odor, Aeration, Ultraviolet radiation, Filtration, Water reuse.

A treatment method for raw sewage has been patented. The sewage is passed to a primary digestion tank where it is digested by bacterial action. From the primary digestion tank, the sewage is conducted to a second stage digestion tank to obtain more complete bacterial action and further digestion. The digested product is selectively passed from the second tank alternately through one of two strainers composed of plastic screening material with approximately a one fourth inch mesh. The product from the strainers is then passed to each of three settling tanks for a predetermined amount of time, permitting any remaining sediment to settle to the bottom of the tank. A portion of the product from the settling tanks is returned to the primary digestion tank for recirculation at predetermined intervals. The settling tanks product is selectively passed to one of two filtering and odor neutralizing cells in an alternate sequence, which is controlled according to the fluid conducting conditions of the cells. From the filtering and odor removal cell, the product than passes to an aeration-radiation unit, where it is broken up into minute particles and treated with sterilizing ultra-violet radiation. The resultant product is a reusable odorless liquid. (Kramer-FIRL)

TWO CITIES TEST REVERSE OSMOSIS SYSTEM.
The American City and County, Vol 90, No 9, p 122, September, 1975.

Descriptors: *Sewage disposal, *Pilot plants, *Reverse osmosis, *Calfornia, *Irrigation, Salinity, Water purification, Waste water treatment, Recycling, Water reuse.
Identifiers: Salt removal, Waste water reuse.

A pilot project for the removal of salts from treated waste water is being developed by the cities of Escondido and San Diego, California. Secondary sewage effluent (about 150,000 gpd) from the Escondido southside water reclamation facility had been limited in use to pasture irrigation because its dissolved salt content was 1550 ppm. With this system, a reverse osmosis method will reduce the salinity by 95% to approximately 75 ppm. The treated water will be recombined with conventional effluent to produce a mixture suitable for irrigating plants and shrubs with low to moderate salt tolerance. The cities plan to use the water to irrigate a golf course and other areas in the Escondido Kit Carson Park. Other reverse osmosis systems have been successful in California industrial plants. One such example is the Burroughs Corporation in San Diego, which has reduced its water purification costs by 75% with a 50,000 gpd reverse osmosis system. (Kramer-FIRL)

CURRENT TRENDS IN PACKAGED WASTEWATER TREATMENT FACILITIES, PART II,
New Jersey Inst. of Tech., Trenton. Dept. of Civil and Environmental Engineering.
R. Dresnack, and W. Miller.
Water and Sewage Works, Vol 122, No 9, p 96-99, September, 1975, 11 fig.

Descriptors: *Waste water treatment, *Treatment facilities, *Aeration, Biological treatment, Anaerobic conditions, Aerobic conditions, Economics, Installation, Oxygen, Oxidation, Disinfection.
Identifiers: Packaged treatment plants, Chemical treatment, Physico-chemical treatment.

A state-of-the-art review of package waste water treatment is presented, including performance data and a selction guide. Extended aeration activated sludge is described; the main components of an extended aeration plant are the bar screen, comminutor, aeration tank clarifier return sludge pump, aerobic sludge digester, and chlorination facilities. Two types of package aeration plants are illustrated. Such package plants can offer the flexibility of many types of combinations of aeration volume and clarifier sizes, for more economical installation. A variation, the Oasis Process, uses pure oxygen in place of air to aerate the mixed liquor. Another package process, the Bio-Disc system, has been designed and fabricated in modules for both package and separate component treatment plants. One type of Bio-Disc plant is

described, which uses a combination of aerobic and anaerobic treatment processes. Other packaged systems are of the chemical and physico-chemical types. Chemical treatment of waste water requires that chemicals react with each other and with the constituents of waste water to produce a flocculant precipitate and thus will either: increase the sedimenation rate; release oxidizing ions to oxidize the organic matter; or kill organisms to disinfect the waste water. METROPOLITAN OPERATED DISTRICT FOR SEWAGE EFFLUENT-IRRIGATION WATER EXCHANGE,
Arizona Water Resources Research Center, Tucson.
C. B. Cluff, and K. J. DeCook.
In: Vol 4: Hydrology and Water Resources in Arizona and the Southwest, Proceedings of the 1974 Meetings of the Arizona Section, American Water Resources Association and the Hydrology Section, Arizona Academy of Science, April 19-20, 1974, Flagstaff, Arizona, p 94-98. 1 fig, 1 ref.

Descriptors: *Water reuse, *Irrigation water, *Water conservation, *Water supply, *Water sources, Sewage treatment, Reclaimed water, Arizona, Water utilization, Planning, Water wells, Irrigation wells, Water management(Applied), Alternative planning, Alternative water use, Groundwater.
Identifiers: Tucson(Ariz).

A plan for the reuse of sewage effluent is proposed for the city of Tucson, Arizona. Several kinds of use would be possible, but utilization for irrigation of existing farmland in the Avra-Marana area seems particularly attractive for several reasons: (1) conveyance can be accomplished by gravity flow, (2) no tertiary treatment is required for the presently grown crops, (3) the nutrients in the effluent would be better used, and (4) effluent use would reduce the pumpage of high quality groundwater, conserving it for municipal or other uses. An exchange of wastewater for groundwater for use in the city system is seen as a good alternative to the present practice of the city purchasing farmland in Avra Valley in order to acquire the groundwater for conveyance to the Tucson basin. Objectives to maximize the quantity and efficiency of wastewater use may not appear compatible with the profit maximization motive of the individual farmer, and suitable provisions will have to be written into wastewater sales agreements to assure coordination between user and supplier. SLIME INHIBITOR FOR USE IN INDUSTRIAL WATER RECIRCULATING SYSTEMS,
J. Tuomarla, K. Raisanen, and A. Arvinen.
U.S. Patent No 3,910,839, 3 p, 3 tab, 6 ref; Official Gazette of the United States Patent Office, Vol 939, No 1, p 341, October 7, 1975.

Descriptors: *Waste water treatment, *Patents, *Water purification, *Industrial water, *Inhibitors, *Recirculated water, Slimes, Fungicides, Bactericides, Chemical reactions, Pulp and paper industry.

When selecting a suitable inhibitor for the treatment of recirculated waters, the primary considerations are the toxicity of the agent, its stability, its ease of application, and its effect on a maximum number of different micro-organism species. Particularly important is the effect of the agent on the maximum number of different species of bacteria, yeast and mold fungi and algae encountered in practice, since in case the effect of the utilized agent with respect of some species is clearly low, these resistant species may be enriched in the system under treatment. This invention relates to a method of inhibition of slime formation in industrial water recirculating systems by treating the systems with 5-nitrofurfurylalcohol, optionally together with further micro-organism inhibitors. These substances are particularly applicable for the recirculated water in the pulp and paper industry. For the effective use of the substances they must be converted into water soluble or easily dispersible form. For such purposes various inorganic and organic acids and aliphatic or aromatic solvents can be utilized. When desired, a small amount of surfactive agents may be added to the solution. (Sinha-OEIS)

METHOD AND APPARATUS FOR TREATMENT OF LIQUID WASTES,
Nittetsu Chemical Engineering Co. Ltd., Tokyo (Japan). (Assignee).
M. Akune, and K. Yoshii.
U. S. Patent No 3,912,577, 5 p, 2 fig, 17 ref; Official Gazette of the United States Patent Office, Vol 939, No 2, p 919, October 14, 1975.

Descriptors: *Patents, *Waste water treatment, Water quality control, Water pollution control, *Industrial waste, *Organic wastes, Waste disposal, Evaporation, Incineration, *Liquid wastes.
Identifiers: High-temperature exhaust gases.

A method and a system is disclosed for treating liquid waste containing a mixture of organic and inorganic substances or organo-metallic compounds by dehydrating, concentrating and combusting it and recovering the ash produced as a slurry, and utilizing the high temperature combustion exhaust gases for concentrating additional waste. The heat evolved from the waste and from the auxiliary fuel is recovered in the form of steam, which is then utilized for reducing the water content of the waste, thus saving in auxiliary fuel consumption. A part of the combustion exhaust gases having temperatures of over 800 deg C is directly injected into a water-containing recovery vessel and any inorganic substances and any ash such as sodium carbonate contained in the exhaust gases are recovered in the form of a slurry, while the remaining part of the exhaust gases is directly contacted with the waste to evaporate the water in the waste and concentrate it. Identifiers: Coke processing plants.

This invention provides an improved (frontw and backward flow) apparatus for and method purifying waste fluid containing waste water a corrosive salts with waste steam from a co quenching apparatus to produce substantially p salt free condensate. The method consists vaporizing a portion of the waste fluid and conc trating the corrosive salts in the residual wa fluid to form a concentrate, heating the conc trate in heat exchange relationship with either h temperature steam or the waste steam; vaporiz a second portion of the concentrate and conc trating the corrosive salts to form a second c centrate; condensing the second vaporized port and the steam to form substantially salt free c densate; and utilizing the substantially salt f condensate in an industrial application. T eliminates the disposal of waste fluid and the c tamination of the atmosphere, if the waste fl were employed to quench the coke in the c quenching apparatus and thus utilizes the wa steam. F. N. Case, and E. E. Ketchen.
U. S. Patent No 3,912,625, 4 p, 5 tab, 7 ref; Offi Gazette of the United States Patent Office, 939, No 2, p 931, October 14, 1975.

Descriptors: *Patents, *Waste water treatme *Industrial wastes, *Water pollution contr *Water quality control, *Adsorption, Liq wastes, Separation techniques, Organic mat Radiation, Radioisotopes.
Identifiers: Regeneration.

A method is disclosed which remo chromophoric organic matter from an aque waste effluent by sorption on a carbonaceous s bent while concurrently regenerating the sorb and converts colored organic compounds i colorless or less colored form. The process is co prised of mixing an aqueous waste effluent c taining dissolved or dispersed chromophoric ganic matter with a carbonaceous sorbent of character described while irradiating the efflue sorbent mixture with high energy radiation. In context of this invention, high energy radiat means that form of radiation which has the capa ty to destroy or convert organic compounds c taining chromophoric groups into colorless or le colored form. In this invention cobalt-60, gamma-emitting isotope, is used as an effect source of high energy radiation. Other function equivalent radiation sources may be used to pr tice this invention, such as Cs-137, Ce-134, Ir-1 and Eu-152, 154. (Sinha-OEIS)

earch was initiated to determine the ap-ty and limitations of the dehydrogenase the measurement of active biomass in al wastewater treatment processes. Pure with E. coli and/or heterogeneous culture udies were conducted on a variety of sub-including glucose, galactose, sucrose, acetic acid, and selected industrial waste-Also conducted were continuous aerobic or anaerobic culture studies with and without solids recycle. Dehydrogenase activity was monitored along with other parameters including plate count, Coulter Counter enumeration, adenosine triphosphate (ATP), and suspended solids to provide comparative and complementary information on the biomass concentration. Dehydrogenase activity was a very sensitive and accurate measure of active biomass throughout the growth phases especially during endogenous growth but showed limitations with the nutrient deficient cultures. The correlation between dehydrogenase activity and suspended solids was constant at varying retention times, or at all growth rates with or without solids recycle. Consequently, a standard curve could be developed for given wastewaters by operating the measurement of active biomass and thereby effectively controlling the biological process. The measurement of ATP was also a reliable new technique for measurement of active biomass except more study on the extraction method is required as well as investigations on the change of the correlation with suspended solids with the change of growth rate. The technique for dehydrogenase activity measurement is simple, less costly and gives more reliable and interpretable results. (EPA)

FOOD FROM SEWAGE. IT CAN BE DONE,
Carnegie-Mellon Univ., Pittsburgh, Pa.
L. J. Young, and J. C. Purcupile.
Water and Wastes Engineering, Vol 10, No 5, p 47-50, June, 1973. 3 fig, 3 tab.

Descriptors: *Sewage, *Yeast, *Pilot plants, *Waste water treatment, *Sewage treatment, Bacteria, Fermentation, Economic feasibility, Disinfection, Nutrients.
Identifiers: Food supplement, Saccharomyces cerevisiae.

The feasibility of a process in which yeast could be grown on sewage, thereby recovering some of the nutrients that are lost and selling the yeast to offset some treatment costs, has been studied. The yeast, Saccharomyces cerevisiae, could be used as cattle fodder, for feeding game fish in either hatcheries or open waters, and possibly as a direct food supplement in foreign countries. A pilot plant was designed to simulate the production of yeast on a large system. Sewage is heated between 180 F and 200 F in a 20-gal reservoir to dissolve some of the solid organic nutrients. The sterilizer, a 16 quart pressure cooker heated with a 750 watt hot plate, reduces the bacteria count in the sewage to zero. The sterilizer is operated at 10 psi above the saturation pressure for water at 260 F to insure that vaporization does not occur during the sterilization process. A batch fermentation process is used to minimize the complexity of the pilot system. It consists of two 30-gal tanks, one mounted above the other. The upper tank is the holding tank and its contents are emptied periodically into the lower tank, the fermentor where sewage is fermented for 24 to 48 hours. The fermentor empties into 5-gal containers where the yeast is centrifugally separated from the growth media. The control system, consisting of a fermentation cycle timer, monitoring equipment, and safety system, allows the pilot plant to operate with only periodic monitoring and can shut down the plant in the event of a malfunction. The economic feasibility of the process is dependent on the yeast yield. If the yield is at least one percent by weight, then the system is economically attractive. (Sandoski-FIRL)

ANAEROBIC DIGESTION OF DAIRY FARM SLURRY,
Surrey Univ., Guilford (England). Dept. of Biological Sciences.
C. Bell.
Effluent and Water Treatment Journal, Vol 13, No 4, p 232-233, April, 1973. 2 fig, 1 tab, 4 ref.

Descriptors: *Waste water treatment, *Anaerobic digestion, *Dewatering, Dairy industry, Sampling, Oxidation, Acids, Pilot plants.

A pilot scale anaerobic digester has been designed and constructed to evaluate operating parameters for a digester treating dairy farm slurry. The digester at Merrist Wood Agricultural College, England, has been operating since January 1973. Tests performed on samples from the feed mixture, the digester, and the primary oxidation tank included permanganate value, dewaterability, pH using wide range pH indicator papers, and volatile fatty acid analyses. The acetic and propionic acid levels in the digesting material increase during the acid phase of digestion; isobutyric and butyric acids also appear in this phase. No acids are detectable in the secondary tank indicating a rapid decrease in volatile acids in the presence of air. The semi-continuous digestion process reduces the permanganate value by 25 to 33% of the original value. The dewaterability value increased from greater than one hour to 45 seconds after digestion. These results demonstrate that an efficient anaerobic system is operating within the digester. (Sandoski-FIRL)

TREATS HUGE FLOWRATES,
D. E. Henke.
Food Engineering, Vol 45, No 6, p 70-71, June, 1973. 2 fig.

Descriptors: *Waste water treatment, *Industrial wastes, *Biological treatment, Food processing industry, Trickling filters, Plastics, Flow rates.
Identifiers: *Flocor, Milk plant wastes, Potato processing waste water.

A biological treatment tower, used extensively in Europe and proven effective in treating milk plant wastes and potato waste water, works on biological and physicochemical principles similar to those in trickling filters. However, hydraulic loads 10 to 15 times greater than in trickling filters are permitted by the system's 97% void ratio. The rigid vinyl plastic packing is lightweight, durable, inert, dimensionally stable, and immune to bacteriological attack. Modules of the material with a surface area per unit volume of 29 sq ft/cu ft are placed at right angles to the one below it. The size, shape, and regular arrangement of voids formed between flat and corrugated sheets of packing provide an optimum combination of air-liquid flow and surface area for bios growth. ENVIRONMENTAL SYSTEMS LABORATORY.
Consulting Engineer, Vol 40, No 6, p 90-91, June, 1973. 2 fig.

Descriptors: *Food chains, *Treatment facilities, *Waste water treatment, *Tertiary treatment, *Sewage treatment, Shellfish, Agriculture, Algae, Nutrients, Cooling water, Thermal powerplants, Design criteria, Laboratories.

The Environmental System Laboratory at Woods Hole, Massachusetts, has been designed to simulate on a realistic scale the environmental conditions and interaction of a natural food chain. It will allow demonstrations of tertiary sewage treatment system made economically feasible by the production of food. The project will demonstrate on a significant scale a tertiary sewage treatment system linked with use of cooling water from nuclear and fossil fuel thermal powerplants, for widespread coastal-zone application. Oysters, clams, mussels, and scallops will be fed with micro-algae grown in seawater with nutrients from secondary sewage treatment. Aquatic animal wastes will be removed by macro-algae in a settling basin. The physical set-up consists of concrete raceways and lined algae ponds, various water conditioning control and product handling facilities, a laboratory for specialized small-scale testing, and pipelines for

ambient and heated seawater, secondarily treated sewage, compressed air, and algae. (Sandoski-FIRL)

TRAVELING BELT FILTER TACKLES WASTE-WATER.
Food Engineering, Vol 45, No 6, p 78, June, 1973. 1 fig.

Descriptors: *Waste water treatment, *Food processing wastes, *Filtration, *Dewatering, Sludge treatment, Equipment.
Identifiers: Brewery wastes, Sludge dewatering filter.

A sludge dewatering filter which uses a molded deck fitted over a drum to produce relatively dry solids for convenient disposal is described. The design allows access to all filtrate passages to facilitate cleaning and maintenance. There are no internal filtering components in the drum. It has external filtrate channels, removable flush-out plugs, and external pipes and valves. This filter has been used at a brewery for dewatering diatomaceous earth, carbon black, and other beer filtering wastes. Solids can be dewatered to 35 percent dryness. (Sandoski-FIRL)

REMOVES MOISTURE FROM WASTE PRODUCTS.
Food Processing Industry, Vol 42, No 498, p 28, April, 1973. 1 fig.

Descriptors: *Waste water treatment, *Food processing industry, *Sludge treatment, *Drying, Evaporation, Evaporators, Centrifuges.
Identifiers: Meat industry wastes, *Evaporative-drying techniques.

The Carver-Greenfield process, suitable for treating meat industry wastes, is designed to remove all moisture from sludges and other waste products. The oil-based evaporative-drying technique is odorless, creates no air or stream pollution, and produces dry, sterile solids of uniform consistency which can be burned as as boiler fuel, stored without decomposition, or bagged and marketed. The system can handle nontreated waste or raw sludge directly from primary and/or secondary treatment. Processing is unaffected by high percentages of solids, fats, or oils. Resultant solids may be reclaimed or burned to generate steam and electric power to run the system. The process is continuous and fully automatic. All available water from solutions, slurries, and sludges can be removed and purified, resulting in the elimination of waste water disposal problems. The three basic components of the system are a fluidizing tank, an evaporator, and a centrifuge. Additional units are added as necessary for each situation. The choice between multi-stage and single-stage drying evaporators depends on cost factors. (Sandoski-FIRL)

OVERCOMES PHOSPHATE PROBLEM,
McCombs-Knutson Associated, Inc., Minneapolis, Minn.
W. H. McCombs, and K. L. Van Aacken.
Food Engineering, Vol 45, No 6, p 72-73, June, 1973. 1 fig, 1 tab.

Descriptors: *Waste water treatment, *Food processing wastes, *Biochemical oxygen demand, *Phosphorus, Lime, Polyelectrolytes, Chlorine, Nutrient removal.
Identifiers: *Cheese processing wastes.

Increased cheese production and a change in effluent standards has prompted Bongards Creameries to employ biological and chemical treatment processes to reduce BOD from 1700 mg/liter to 55 mg/liter and phosphorus from 35 mg/liter to 4.7 mg/liter. In the process, lime is added at a point just beyond the settling tank. Lime raises the pH to 9.5-12, causing the phosphorus in solution to form an insoluble precipitate. Adding a polyelectrolyte causes the precipitate to agglomerate and form large clumps of material which settle out. This settled material is disposed of by lagooning. About 500-600 pounds of lime per day and one mg/liter of the polyelectrolyte are used. Flow is about 150,000 gpd. To reduce BOD in the two existing treatment ponds, two 30 hp Mixco Lighting platform aerators were added to the second pond. A by-pass was also added to permit effluent to go directly to the second pond. A section of the effluent pond was divided by steel sheeting installed to form a settling tank. The bottom of this settling area was covered with concrete grouted over a rock fill. Sludge is removed from the bottom of the settling area and returned to the incoming flow. After the settling area, waste is treated with lime and polyelectrolyte. The treated waste passes through a clarification chamber over the weir into a two cell contact tank. Necessary pH adjustments are made and chlorine is added to the second cell to meet coliform requirements. From here the wastes go to a ditch where they mix with cooling water. (Sandoski-FIRL)

WASTEWATER TREATMENT AT FORD'S WINDSOR COMPLEX,
Ford-Windsor Complex (Ontario).
S. H. Vaughn, and R. S. McCurdy.
Industrial Wastes, Vol 19, No 3, p 34-36, 38, 40, 43, May/June, 1973. 3 fig, 6 tab.

Descriptors: *Waste water treatment, *Industrial wastes, Treatment facilities, Oil, Suspended solids, Phenols, Oily water.
Identifiers: *Automotive industry.

The principal pollutants at Ford's Windsor Complex are oil, suspended solids, and phenol traces. The water treatment program designed to handle them involves segregation of specific waste streams, change and control of processes, and installation of treatment facilities which could operate over a wide range of conditions. The Windsor oily waste treatment process consists of three 200,000 gal waste treatment batch tanks equipped with acid proof linings, air mixers, and oil skimming troughs. Skim oil, from the treatment tanks, is directed to two 10,000 gal steam heated tramp oil tanks where oil is concentrated and passed to a 10,000 gal storage tank. Water, separated from the tramp oil, is returned to the waste treatment plant influent wet well while the tramp oil is burned with primary fuels. The casting plant waste water is first directed to two slag pits equipped with dragout flights which provide a short settling time to allow heavy slag particles and gritty material to settle. The waste water is then conveyed to the clarifiers wet well where two 7600 gpm constant speed mixed flow vertical pumps lift the waste water to a flow splitter chamber. Sedimentation occurs in two 110-foot diameter clarifiers with 25 x 8 foot center flocculating zones. The clarifier detention time is 3.8 hours with a weir overflow rate of 2500 gpd/lf. One measure to minimize the phenols at casting plants is to purchase coke which has not been quenched with phenolic bearing water. Process equipment operating with phenolic materials for binders has been redesigned to collect dust with dry air pollution control equipment. Phenolic-based paints have been eliminated and use of phenolic biocides in coolants minimized. (Sandoski-FIRL)

FLUIDIZED-METAL TRAPS METAL.
Chemical Engineering, Vol 80, No 13, p 78, 11, 1973. 1 tab.

Descriptors: *Waste water treatment, *Indu wastes, *Heavy metals, Mercury, Cadm Chromium, Lead, Pilot plants, Waste disposal, Recycling.
Identifiers: Electrochemical stripping.

Mercury, cadmium, chromium, lead, and metals are being successfully removed from i trial waste water. A fluidized bed of condu particles across which a low-voltage direct cu is applied causing metallic impurities to plat on the bed particles. Chemical or electroche stripping can be used to recover the heavy wastes and to regenerate the bed. The pretreatment necessary is adjustment of the water pH to about 7. The system works suc fully even at low concentration levels. It is being used in a pilot plant unit. The conduc requirements for the process have not been r determined, but is is known that the same re can be obtained with a lower electrolytic co tivity by increasing cell voltage or decre cathode-collector-anode spacing. Test result dicate that 100 to 200 ppm of dissolved salts vide adequate conductivity. The proposed ment system would feed brine (4300 lons/minute) plus washwater (400 gallons/mi to five parallel cells, each capable of handling gallons/minute. The cells would decrease the centrations of copper and other heavy meta levels that would eliminate tubing erosion and mit disposal of the desalting plant effluent int sea. (Sandoski-FIRL)

Identifiers: Etching shop wastes, Metal industry.

A process for the removal of excess calcium sulfate from etching shop-generated, neutralized effluents for use in the recycling process has been developed. Waste water containing sulfuric acid and iron salts is neutralized with slaked lime, after which the excess gypsum is removed by seeding with 15% gypsum pulp added at the expenditure of water (0.05-0.6 grams per liter). Following seeding in a flocculating chamber under permanent agitation for 30 to 40 minutes, the neutralized and seeded water is sent to a settler from which the sludge is removed for mechanical dewatering, and the stabilized water, possibly after final treatment, is mixed with fresh water for recycling in the etching process. TWO-STAGE BIOLOGICAL SYSTEM CUTS SPACE.
Modern Power and Engineering, Vol 67, No 6, p 40-41, June, 1973, 2 fig.

Descriptors: *Waste water treatment, *Industrial wastes, *Biological treatment, Aeration, Microorganisms, Equipment, Activated sludge.

A two-stage biological reaction system for treating wastes at National Starch and Chemical Company Limited's plant at Collingwood, Ontario, has been very successful. The system replaced the original trickling filter system, permitting compliance with the town's sewer by-law. The two-stage biological reaction system has reduced by two-thirds the total aeration tank capacity required by a single-stage installation. The two-stage system has also reduced microorganism loss during occasionally severe winter conditions. An important part of the design was to provide aeration equipment capable of economically meeting the present varying oxygen demands, yet suitable for future expansion. Two Lightnin submerged-turbine aerators, driven by two-speed motors, plus a compressed air system provide this capability. The waste flow can be fed to an aeration tank or by-passed depending on BOD loading. The normal flow pattern is for the wastes to pass through each tank in series. Following aeration, the waste flow is clarified before being passed to the secondary stage where the aeration and clarification steps are repeated. Activated sludge is cycled back or pumped from the secondary clarifier to an aerated sludge holding tank for eventual disposal. (Sandoski-FIRL)

COAL FINES RECOVERED FROM WATER BY FROTH-FLOTATION.
Industrial Water Engineering, Vol 10, No 3, p 6, May-June, 1973, 1 fig.

Descriptors: *Waste water treatment, *Industrial wastes, *Coals, *Froth flotation, Filtration, *Patents, Separation techniques, Recycling.
Identifiers: *Coal fines recovery.

A patent has been granted for a method of separating and recovering fine particles of coal from water. The method involves use of a froth-flotation process to treat the water-coal slurry. The fine particles of coal are floated out in a froth, which is created by adding a reagent to the slurry, and recycled to the filter where the coal is recovered. The remaining water in the froth-flotation cells contains less than 0.1% of fine particles of coal. (Sandoski-FIRL)

Investigations for a substitute for the biochemical oxygen demand (BOD) determination in waste

LIBRARY U. OF I. URBANA-CHAMPAIGN

water resulting from food processing industries have included the study of correlations between the former and chemical oxygen demand (COD) or permanganate value (PV). Procedures used in the determination of COD included the potassium dichromate, potassium permanganate, potassium iodate, and ceric sulfate methods. The approach using potassium dichromate in strong acid solutions appeared to be the most effective in application. The correlation between these two parameters is valid, however, only when applied to water featuring similar characteristics. The dichromate procedure is quick and very useful during the water treatment plant design stage. It also provides the possibility of detecting sudden variations in the pollutant load of an effluent associated with specific stages of the industrial process. (Takacs-FIRL)

THE CLARIFICATION PLANT OF THE CHEMICAL COMPLEX OF THE TOWN JAMBOL (DIE ABWASSERREINIGUNGSANLAGE DER CHEMIEKOMBINATS DER STADT JAMBOL),
J. Diadowski.
Wasser und Boden, Vol 25, No 5, p 141-142, 1973. 1 fig, 1 tab.

Descriptors: *Waste water treatment, *Industrial wastes, *Textiles, *Treatment facilities, Biochemical oxygen demand, Activated sludge, Neutralization, Sludge treatment, Lagoons.
Identifiers: Synthetic fiber production wastes, *Bulgaria(Jambol).

A waste water treatment plant for a synthetic fiber manufacturing complex in Jambol, Bulgaria, has been designed for a waste water capacity of about 60 cu m/hr with an average BOD value of 1320 mg/liter. The system comprises a neutralization unit, an activated sludge basin with pH adjustment, a final purification step, a sludge thickener, a lagoon, and a diluting unit in which the treated water is diluted with fresh water to limit the BOD to 50 mg/liter. The effluent to be sent into the activated sludge basin is first combined with phosphoric acid and carbamide to increase its nutrient content. A considerable increase in the treatment plant load and subsequently in the recycled sludge index and BOD value, due to plant expansion, was determined. The sludge index, exceeding 100 ml/gram against a nominal range of 20-60 mg/liter, can be made normal by the addition of aluminum sulfate and calcium hydroxide. (Takacs-FIRL)

REMOVAL OF BENZIDINE FROM INDUSTRIAL WASTE WATERS, (DEKANTSEROGENIZATISIYA PROMYSHLENNYKH STOCHNYKH VOD, SODERZHASHCHIKH BENZIDIN),
V. A. Genin.
Gigiyena i Sanitariya, No 3, p 105-107, 1973.

Descriptors: *Waste water treatment, *Chemical wastes, Separation techniques, Chemical reaction, Public health, *Industrial wastes.
Identifiers: *Carcinogens, *Benzidine, Bis-diazodiphenyl.

A method for the removal of carcinogenic benzidine from benzidine sulfate-containing waste water generated by a benzidine manufacturing process has been developed. Both filtrate and benzidine sulfate-contaminated waste water are sent first into a settler for the separation of suspended solids. The waste water, diluted with fresh water, is then sent into a diazotization apparatus in which a 20-percent solution of sodium nitrite is added for the conversion of benzidine sulfate into bis-diazodiphenyl. This product has yet to be proven carcinogenic. (Takacs-FIRL)

COMPLETE REUSE OF TEXTILE DYEING WASTES PROCESSED WITH DYNAMIC MEMBRANE HYPERFILTRATION,
Clemson Univ., S C. Dept. of Textile
C. A. Brandon, J. S. Johnson, R. W. Minturn, and J. J. Porter.
Textile Chemist and Colorist, Vol 5, No 7, p 35-38, Jul., 1973. 3 fig, 4 tab, 11 ref.

Descriptors: *Waste water treatment, *Industrial wastes, *Textiles, Membrane processes, Separation techniques, Dyes, Color, *Water reuse, *Recycling.
Identifiers: *Hyperfiltration, Synthetic fibers production.

Hyperfiltration through dynamically formed dual-layer hydrous Zr(IV) oxide polyacrylate membranes on porous ceramic and carbon tubes removed greater than 85% of the organic carbon from the effluent from a textile finishing plant processing most synthetic fibers. Production rates were 40 to 80 gpd/sq ft at 1000 psig and 60 C. Color rejection was greater than 99%. Eighty-seven percent water recovery was achieved without deterioration of membrane performance. The purified product and the concentration residue from the treatment of the dye waste have been directly reused in critical test dyeings. The reuse of chemicals in the product and/or residue may provide an important economic advantage. Since the waste water can be treated at process temperatures the reuse of hot water will also reduce costs. (Sandoski-FIRL)

ELECTROCHEMICAL PROCESS FOR EFFLUENT,
J. G. Noble.
Process Biochemistry, Vol 8, No 6, p 19-20, 34, June, 1973. 1 fig, 80 ref.

Descriptors: *Waste water treatment, *Industrial wastes, Electrochemistry, Electrodes, Effluents.
Identifiers: *Electro-M-process, *Electrochemical treatment.

An electrochemical process for the treatment of highly polluted effluents is discussed. This process, known as the Electro-M-process, includes the following general details. Effluent from the works is pumped from a buffer reservoir to the reactor basins of an Electro-M plant. The discharge pump from the buffer reservoir can be provided with minimum and maximum contacts; the contacts can control the starting and termination of the treatment. In each reactor basin there are motor-driven stirrers for mixing the sludge. Electrodes in the basins are arranged such that one anode is situated between two cathodes. All electrodes are in plate form and are suspended vertically downwards into the effluent from supports fixed to the reactor basin. The spacing of the electrodes is controlled to ensure that the voltage is not affected. Normal depth of the reactor basin is about 1.5 meters. The system can measure flow, pH, and conductivity at the inlet, and Redox-potential, voltage and current in the reactor basins, as well as oxygen, pH, and turbidity in the discharge. (Sandoski-FIRL)

MASSIVE LIME TREATMENT COLOR REMOVAL FROM KRAFT EFFLUENTS,
International Paper Co., Mobile, Ala.
R. S. Wright.
Paper Trade Journal, Vol 157, No 24, p 29-30, June 11, 1973.

Descriptors: *Waste water treatment, *Industrial wastes, *Pulp and paper industry, Pilot plants, Lime, Cost, Color, Louisiana.
Identifiers: Bleached kraft pulp wastes, Decolorization.

A demonstration plant has been constructed ternational Paper Company's mill at Spri Louisiana, for the decolorization of kra fluents. The plant designed to treat 530 gpm fluent using 20 thousand ppm of lime, operated from February 1970 until August The major difference between the massive process evaluated in this project and e processes is in the amount of lime used. The sive lime process employs a excess of li produce a heavy and readily settleable sludge massive lime system cannot be operated as a treating plant clarifying a given flow and a organic load but must be able to fluctuate variation in the mill's production. Massive treatment can remove more than 90% of the bodies contained in effluents from the b caustic extraction stage and the final unble pulp washing stage. These two stages contribu to 75% of the total color load produced i manufacture of bleached kraft pulp. Massive treatment in the pulp mill's liquor caustic operation will dilute the cooking liquor. Thi increase the volume of liquors handled throu the pulp mill's processes necessitating inc capacity in most of the chemical preparatio recovery equipment. For a typical thousan per day mill using the massive lime system to four million gallons of effluent per day, the will be approximately $1.80 per ton of blea pulp, based on current raw material and ut costs. T PULP AND PAPER MILL POLLUTION EMENT, MODERINIZATION, AND EX- ION.
lting Engineer, Vol 40, No 6, p 94-95, June 2 fig.

iptors: *Waste water treatment, *Industrial s, Pulp and paper industry, Color, Water , Recycling, Biochemical oxygen demand, iana, *Pulp wastes.
ifiers: *Unbleached kraft pulp wastes, chemical pulp wastes.

Continental Can Company of Hodge, Loui- , has initiated modernization and expansion tter water pollution control at an unbleached and semi-chemical pulp and paper mill. A scale color removal system was designed criteria established in laboratory and pilot facilities. New standards for unbleached waste effluent treatment were also developed. Existing waste water treatment facilities may now handle the double plant capacity, after water consumption reduction by 30% through recycling and utilization of the color removal system to further reduce BOD in the waste effluent. High efficiency air emmission control systems were selected and permit the reduction of 55% and 30% of 1969 particulate and odorous emissions. Initial operation has been successful, particularly the color reduction in the waste effluent. Effluent BOD was also within the required levels. The total investment necessary was determined to be less than two-thirds the cost of constructing a new plant of equal capacity. (Sandoski-FIRL)

TEXTBOOK ROUTE STOPS MERCURY LOSS.
Canadian Chemical Processing, Vol 57, No 6, p 50, June 1973, 1 fig,

Descriptors: *Waste water treatment, *Industrial wastes, *Mercury, Chlorine, Chemical precipitation, Filtration, Chemical wastes, *Recycling.
Identifiers: Chlor-alkali plants, Mercury recycling.

The release of mercury to the environment has been controlled at a chloralkali plant of FMC of Canada by a simple, chemical add-on process. All mercury-bearing liquid wastes are sent to a concrete pit where sodium sulfide is added. This precipitates soluble mercury in the waste water as insoluble mercury sulfide. The extremely dilute slurry from the pit is then filtered to remove mercury sulfide and other solids. The filter cake is collected and held for futher processing. All solid wastes are treated to solubilize the mercury compounds in them. The HgS filter cake is combined with muds from the brine-treating clarifier. These solids react with caustic and chlorine in an agitated vessel. The resultant slurry is filtered, and the mercury-rich filtrate is recycled to the electrochemical cells. There it is reduced to elemental metallic mercury and returned to the moving mercury cathode at the base of the cell. Since the patented process has been in use at the chlorine plant, the total mercury discharge in both liquid and solid wastes has averaged less than 1.5 pounds per week. (Sandosk--FIRL)

WASTE WATER COOLANT.
Engineering News-Record, Vol 191, No 12, p 14, July 12, 1973.

Descriptors: *Waste water treatment, *Cooling water, *Water resue, Tertiary treatment, Lime, Oxidation, Denitrification, Phosphorus, Heavy metals, Biochemical oxygen demand, California.

Construction is planned for a 30 mgd tertiary waste water reclamation plant to supply coolant water for five industrial users at Suisun Bay, San Francisco. The five companies (Phillips Petroleum Company, Shell Oil Company, Stauffer Chemical Company, Monsanto Company, and a Pacific Gas and Electric Company power station that serves Shell) will be linked to the plant by four miles of existing pipeline. The system could potentially be extended to another 20 to 30 industrial users. The treatment process combines lime treatment with oxidation and denitrification. Sand and grit are first screed from in-coming waste; lime is used to cause phosphorus, heavy metals, and other solids to sink to the bottom of the sedimentation tank. The liquid then enters an aeration and nitrification tank where bacteria and microorganisms feed an oxygen-demanding materials. In subsequent processing stages, nitrogen compounds are converted to nitrogen gas, which in turn is released by bubbling air through the liquid. Process testing resulted in 99% BOD removal. Phosphorus and nitrogen were reduced to 0.5 and 2 ppm, respectively. (Sandoski-FIRL)

NEW FILTER PRESS ENHANCES SLUDGE DEWATERING KNOWHOW.
Chemical Engineering, Vol 80, No 16, p 46, 48, July 9, 1973. 2 fig.

Descriptors: *Waste water treatment, *Sludge treatment, *Dewatering, Filtration, Equipment, New Jersey.
Identifiers: *Filter presses.

A filter press for sludge dewatering that produces filter cakes with a solids content of 35 to 60% (compared with 25% or less for conventional methods) has been developed by the Nichols Engineering and Research Company of New Jersey. The unit's efficient dewatering is achieved by a new filter-plate design. Cylindrical-shaped pips or protrusions characterize the unique plate surface. Because of their geometry and distribution, only one-third of the plate is needed to support the filter cloth. The remainder is left free for more-efficient filtrate drainage. The plates are unaffected by acid or other washes, and cleaning time can be reduced by in-place removal of carbonate deposits from the filter cloths. The filter press may be operated through its entire cycle--loading, filtering, dumping, and reloading--with a single lever. Moving it one way retracts the moving end of the press, and at the same time activates a plate-shuttling mechanism so that freed cake can drop out unassisted. The filter press is available in a traditional square configuration and also in a space-saving rectangular style (72 x 48 inches). Operating pressures are generally in the 50 to 100 psi range. ROTATING BIOLOGICAL SURFACE.
Industrial Water Engineering, Vol 10, No 3, p 48, May-June, 1973.

Descriptors: *Waste water treatment, *Biological treatment, Equipment, Costs, Trickling filters, Activated sludge, Biodegradation, Microorganisms.
Identifiers: *Rotating biological surface(RBS).

A rotating biological surface (RBS) waste treatment process has been shown to be more effective and less costly than the trickling filter and many activated sludge processes. The RBS is a series of closely-spaced vertical discs, mounted on a horizontal, externally-driven shaft. The shaft is supported by bearings and is slowly rotated, alternately exposing the disc surfaces to the waste material and then to the air. The waste liquid is slightly less than half the disc diameter. Waste material containing bacteria continuously flows parallel to the discs, forming a growth. The growth produced is a uniform biologic mass which covers the disc surface evenly. Contact between the waste material and the biomass is provided by multi-directional flow through the biomass during exposure to the waste liquids. The stablized biomass on the discs oxidizes the waste material into metabolic byproducts and excess cell material. Process advantages include: low installation, operating, and maintenance costs; resistance to hydraulic shock loads; resistance to organic shock loads and toxic spills; and, minimal process control requirements. Berichte der Abwassertechinschen Vereinigung E.V., No 25, p 294-311, 1972. 8 fig, 12 ref.

Descriptors: *Waste water treatment, *Food processing industry, Trickling filters, Biological treatment, Biochemical oxygen demand, Pre-treatment.
Identifiers: *Slaughterhouse wastes, Plastic media, West Germany.

The waste water purification process used at an animal plant in Icker, West Germany, is a trickling filter with a plastic foil packing material. This is used as the first biological stage in which a BOD decrease of 70-80% is achieved, through 5- to 6-fold recycling, at a load of 2-3 kg BOD per cu m day. The water from the trickling filter is further purified in a second, fully biological stage. In principle, it is possible to efficiently purify these effluents by means of a single, low-load biological stage, and to reduce the specific pollutant load of such effluents by up to 50% through adequate technological modifications. The second biological stage has a satisfactory efficiency despite a phosphorus deficit of 60 to 70%. However, very high ammonium nitrogen and nitrite nitrogen contents in the second biological stage lead to considerable inhibition of the organic matter decomposition. To reduce these contents, chemical pretreatment is necessary. (Takacs-FIRL)

NEW WESTINGHOUSE PLANT PRODUCES COMPLETE LINE OF WATER AND WASTE-WATER TREATMENT EQUIPMENT.
Water and Sewage Works, Vol 120, No 5, p 54-56, June 1973. 4 fig.

Descriptors: *Water treatment, *Waste water treatment, Equipment, Industrial production, Marketing, Planning, Transportation, Treatment facilities.

The Infilco Division of Westinghouse Electric Corporation is operating a facility built exclusively for the design and fabrication of many types of water and waste water treatment equipment. The plant can produce treatment equipment for industrial, municipal, electric utility, and marine applications. In-house fabrication ability allows for substantial control of product quality, scheduling, and shipping. The location of this plant, at the center of the East Coast's business, and supply markets for water and waste water treatment equipment, is ideal. Access is easy to interstate highway and rail facilities, particularly to the ports of Norfolk, Virginia, and Baltimore, Maryland, which simplifies overseas shipment. Products may be shipped by rail or truck according to the customer's preference. Products are shipped either assembled or disassembled, depending on size and/or customer preference. (Sandoski-FIRL)

TREATING EFFLUENT IN MIDLANDS FACTORY.
Metal Finishing Journal, Vol 19, No 221, p 174, June 1973.

Descriptors: *Treatment facilities, *Metals, *Waste water treatment, Effluents, Pumps, Suspended solids, Sulfur compounds, Nitrogen compounds, Installation, Tanks, Flocculation, Coagulation, Industrial wastes.
Identifiers: *Metalic wastes, Nitric acid, Sulfuric acid, England.

An effluent treatment plant has been installed by High Duty Alloys Limited, Smethwick, England. The plant will handle liquors arising from the etch shop process, and will treat a continuous flow of up to 2000 gal/hr of a mixture of metals, sulfuric and nitric acids, and a caustic solution. To ensure that an average strength effluent is fed forward for treatment, processing wastes are pumped by separate pumps, one for alkali, the other for acid, to respective holding tanks where they are blended with the metallic wastes. Mixed effluent is then pumped by one of two transfer pumps to the neutralization tank. The pH is adjusted by dosing with milk of lime solution until it is in the range 8-9. Treated effluent flows by gravity to the control feed well of the settlement vessel in which coagulation and flocculation of the suspended matter occurs, thus improving the settling characteristics of the solids and suspended matter in the effluent. These solids and suspended matter settle out under gravity and collect in the conical section of the settlement vessel. The resultant, clear, supernatant liquid overflows a peripheral weir and flows to the drain. (Sandoski-FIRL)

EFFLUENT TREATMENT PLANT.
Metal Finishing Journal, Vol 19, No 221, p 176, June 1973.

Descriptors: *Treatment facilities, *Effluents, *Waste water treatment, Industrial wastes, Sulfur compounds, Automation, Control systems, Filtration.
Identifiers: *Sulfuric acid, Pickle liquors, Metal wastes.

An effluent treatment plant has been designed and installed by Head Wrightson Process Engineering Limited. The facility neutralizes a maximum flow of 15,000 gal/hr of spent pickle liquors containing 5000 ppm of sulfuric acid or the equivalent concentration of hydrochloric acid. Automatic control is designed to enable the plant to deal with a variation in flow from 2000 up to 15,000 gal/hr. Neutralization is achieved using the carbonate process whereby acidic wastes flow upward through a stirred bed of 1/4- to 3/8-inch limestone chippings. Carbon dioxide is removed by passing the neutralized liquor through a bank of aeration cells. Conventional clarification and filtration follow, prior to effluent discharge. (Sandoski-FIRL)

TREATING CONTAMINATED WATER.
French Patent FR 2149717. Issued March 30, 1973. Derwent French Patents Reports, Vol U, No 22, p D5, March, 1973.
Identifiers: *Patents, *Pulp and paper industry, *Waste water treatment, *Industrial wastes, Activated carbon, Adsorption, Tanks, Mixing.

A patent has been issued to the St. Regis Paper Company for treating contaminated water using activated carbon. The method involves continuously discharging the contaminated water into the first of a plurality of tanks while simultaneously and continuously discharging fresh powdered activated carbon into the last of the series of tanks at such a rate that a slurry density between 50 and 200 grams of activated carbon per liter the tanks is stirred and portion of the contents of each of the tanks are withdrawn. These are either substantially free from solid particles or consist entirely of solid particles. Each portion is forced successively into a consecutive tank of the series; treated water free from solid particles is withdrawn from the last tank of the series. (Sandoski-FIRL)

PROCESS WATER REUSE AND UPSET CONTROL MODIFICATION AT AN INTEGRATED NSSC MILL,
Green Bay Packaging, Inc. Wis. Mill Div.
W. R. Nelson, G. O. Walraven, and D. C. Morris.
Tappi, Vol 56, No 7, p 54-57, July, 1973. 8 fig, 2 tab.

Descriptors: Pulp and paper industry, Water pollution control, *Water reuse, Reverse osmosis, *Waste water treatment, Industrial wastes, Suspended solids, Biochemical oxygen demand, *Treatment facilities, Monitoring, *Pulp wastes, Wisconsin.

The pulp and papermaking operation at the Green Bay, Wisconsin, neutral sulfite semichemical mill is described. The generation and distribution of solubles in the process and excess waters of the mill are also discussed. The arrangement consists of mill sewers, recycled water flows, spill surge flow, and an internal monitoring control system. Waste water handling with a proposed reverse osmosis operation is detailed. Mill production control experience has achieved monthly average loss levels of 11.0 pounds of BOD per pulp ton and 1.7 pounds suspended solids per machine ton. The upset control system short term experience suggests that consistent loss levels of 5.0 pounds of BOD per pulp ton and 1.0 pound suspended solids per machine ton will be achieved. (Sandoski-FIRL)

RECOVERY PLANT RECYCLES OIL WASTE.
Secondary Raw Materials, Vol 11, No 6, p 98, June, 1973.

Descriptors: *Oil wastes, *Waste water treatment, *Recycling, Treatment facilities, Fuels, Indiana, Industrial wastes.
Identifiers: *Waste recovery, Oil recovery, Solids reclamation.

A new oil recovery plant that converts waste oil into a usuable fuel is now operating at Bethlehem Steel Corporation's Burns Harbor, Indiana, steelmaking plant. The oil recovery facility was designed to refine a minimum of 200,000 gallons per month of waste oil into fuel oil for industrial application. The new oil recovery facility was formerly the oil separation plant. Oil recycling process begins at the recovery tank station. The waste product is pumped from there to new refining facilities inside the building for water and solids removal from the oil by acid treatment, filtration, and washing in tanks. The reusable fuel is then pumped to the two large outside storage tanks. Collection of waste oil and distribution of the processed fuel are handled by tank trucks. The solids reclaimed from the oil will be stored until the sintering plant goes into operation. (Sandoski-FIRL)

FILTRATION KEY TO CONVERTING WASTE OIL INTO USABLE FUEL.
Filtration Engineering, Vol 4, No 3, p 14, May/June, 1973.

Descriptors: *Filtration, Oil, *Oil wastes, *Recycling, Industrial wastes, Waste water treatment, Effluents.
Identifiers: Waste oil recovery, *Oil recovery.

The Bethlehem Steel Corporation steelmaking complex at Burns Harbor, Indiana, has implemented a new oil recovery plant for the conversion of waste oil into a usable fuel. The facility will refine a minimum of 200,000 gallons per month of waste oil into fuel oil for industrial usage. Waste products from the plant are pumped to new refining areas, and water and solids are removed from the oil by acid treatment, a Komline-Sanderson filter, and washing tanks. Until Bethlehem Steel finishes a new sintering plant for recycling waste iron-bearing materials from its various production processes, the solids reclaimed from the oil are being stored. Waste water from the oil treatment process is clarified at a secondary treatment facility. From the plant, effluents flow to a newly created lagoon which will protect against the release of untreated materials into the Little Calumet River. Water flows from the river into Lake Michigan. (Sandoski-FIRL)

PACKING PICKLES WITH RECYCLED BRINE.
Agricultural Research, Vol 22, No 1, p 10-11, July, 1973.

Descriptors: *Food processing industry, *Waste disposal, *Recycling, Incineration, Brines, Pilot plants, California, Water reuse.
Identifiers: Combustion evaporation, Salt reuse.

The ARS' Western regional research laboratory in Berkeley, California, has developed a method for reclaiming the salt from pickling brine, thereby keeping it out of the effluent stream. A submerged combustion evaporator is used to crystallize the salt from the used brine solution. In submerged combustion, gaseous combustion products pass directly up from the burner through the brine. Heat is rapidly transferred from the rising gas bubbles directly to the brine through the bubble interface. The condensed brine, changed to a slurry form, leaves the bottom of the evaporator. It contains about 58% solids of which about 6% is combustible organic matter and must be eliminated before the salt is suitable for reuse. These organic contaminants are destroyed by incineration for five minutes at 1200F. Salt is then decontaminated except for a small amount of carbon and is ready for storage. To prepare pickling brine for the next season, the salt is dissolved in water and the carbon removed by simple filtration. The same salt can be reused for five or more seasons. (Sandoski-FIRL)

LIBRARY U. OF I. URBANA-CHAMPAIGN

REMOVAL OF ORGANIC CARBON FROM WATER BY OXIDATION WITH SOLID CATALYSTS,
California Univ., Davis. Dept. of Chemical Engineering.
J. M. Smith.
Available from the National Technical Information Service, Springfield, Va 22161 as PB-248 182, $3.50 in paper copy, $2.25 in microfiche. Technical Completion Report, November 1975, 6 p. (California Water Resources Center, Davis, Project UCAL-WRC-W-392). OWRT A-051-CAL(2).

Descriptors: *Oxidation, *Chemical reactions, *Waste water treatment, *Catalysts, Technical feasibility, Economic feasibility, Kinetics, Organic wastes.
Identifiers: *Organic carbon removal, Liquid-phase oxidation, Solid catalysts, Catalytic oxidation, Trickle-bed reactors.

The purpose was to evaluate the technical and economic feasibility of liquid-phase oxidation of soluble organics in wastewaters using solid catalysts. The procedure was, first, to evaluate the kinetics of catalytic oxidation under conditions where the intrinsic activity of the catalyst could be established. With such kinetic results, the next step was to evaluate different types of reactors for practical use in removing organic pollutants from water. Results from this phase of the work would permit an economic evaluation of the process for comparison with alternative procedures, such as biological oxidation. Collective achieved were to measure intrinsic kinetics for two promising catalysts and to begin the investigation of various reactor types. The work accomplished involved analysis of the performance of trickle-bed reactors for pollutant removal. This appears to be one of the most desirable reactors. A variety of organic pollutants, including refractory acids, can be completely oxidized to carbon dioxide at temperatures of the order of 270C. Maintaining the water in the liquid phase, which requires compressing the liquid to prevent vaporatization, eliminates the energy requirements that would be associated with vaporizing the water. SOME TRENDS IN INDUSTRIAL WATER AND WASTES MANAGEMENT,
Consultancy Services Ltd. (England). Environmental Control.
M. W. Askew.
Dairy Industries (G. B.), Vol 38, No 5, p 211-216, 1973, 3 fig, 3 tab, 9 ref.

Descriptors: *Industrial wastes, *Industrial water, *Waste water treatment, *Dairy industry, Sludge, Biological treatment, Filtration, Flow control, Byproducts, Separation techniques, Sedimentation, Sludge disposal, Water reuse.
Identifiers: *Dairy wastes, England, Wales, Micellization/Demicellization, Desal process, Alwatech process.

Many on-site waste water treatment plants are being constructed by the dairy industry in England and Wales. High rate bio-filters are well suited to dairy effluents. A common system of effluent treatment consists of a combination of flow equalization with fat separation, two-stage high-rate biofiltration with solids sedimentation; low-rate biofiltration and solids sedimentation. Attention must be given to screening of solids, flow equalization of hydraulic and organic loading and cleansing and sterilizing materials, fat separation, and chemical neutralization of effluent acidity to prevent sludge bulking and fungal growth. Water and effluent quantities are reduced more readily and economically than the quantity of polluting material as effluents tend to increase in strength. Highrate biofiltration with bio-aeration may be the best treatment method. Sludge treatment is expensive, so variations of extended aeration and contact stabilization bio-aeration systems which generate minimal quantities of surplus sludge can be used. Sludge can be spread on farm land, treated with cationic polyelectrolytes, incinerated, or edible protein produced by microbial synthesis. Water reclamation and reuse are suggested. Reuse quality requirements must be objectively defined. Possible methods are membrane, ion exchange, filtration, sterilization, and micellization/demicellization. Reclamation processes must be integrated with production needs. (Buchanan-Davidson--Wisconsin)

UHR FILTERS TREATING MILL WASTEWATERS,
De Laval Turbine, Inc., Florence, N.J. Condensor and Filter Div.
J. T. Wallace, and J. S. Brown.
In: Proceedings of the 26th Industrial Waste Conference, May 4-6, 1971, Purdue University, Lafayette, Indiana, Purdue University Engineering Bulleting, Engineering Extension Series No 140, Part 2, p 807-814, 7 fig.

Descriptors: *Waste water treatment, *Filters, *Water purification, *Steel, Texas, Water reuse, Recirculated water, Cooling towers, Suspended solids.
Identifiers: *Ultra High Rate Filter System, Baytonw(Tex), Backwash.

Water supplies for the U.S. Steel Corporation plate mill at Baytown, Texas, are closed systems wherever possible. The Plant Mill Service Water System is a closed recirculation network with blowdown disposal. After heavy solids from mill scale wastes are removed in a scale pit, the remaining wastes plus raw water sludge thickener overflow and make-up water go to a receiving basin. Partially clarified water is pumped through an Ultra High Rate Filter System to a cooling tower, a clearwell, then to the mill for re-use. Filters of anthracite and sand remove particles 1-50 microns in size and finely dispersed oil. Filter design and operation are described. The most important factor for filtration success is a repeatable, effective backwash. An automatic backwash provides a uniform, reliable, repeatable method that is fail-safe, makes troubleshooting easy, reduces maintenance costs, and provides maximum on stream time for each filter. The system has operated since 1970 with few problems. Influents average 28.1 mg/l total suspended solids and effluents 4.4 mg/l. Effluent oil is below 5 ppm. This recirculated water system is practical under widely varying operating conditions, while maintaining recirculated water quality equivalent to or better than the quality of make-up water. THE APPLICABILITY OF CARBON ADSORPTION IN THE TREATMENT OF PETROCHEMICAL WASTEWATERS,
Engineering-Science, Inc./Texas, Austin.
D. L. Ford.
In: 'Applications of New Concepts of Physical-Chemical Wastewater Treatment,' W.W. Eckenfelder, Jr. and L. K. Cecil, editors. Pergamon Press, Inc., Elmsford, N.Y., 1972, p 133-149, 3 tab, 10 ref.

Descriptors: *Activated carbon, *Oil wastes, *Waste water treatment, *Industrial wastes, Water reuse, Biological treatment, Tertiary treatment, Design, Activated sludge.
Identifiers: Refinery wastes, Petrochemical wastes.

No American refineries or petrochemical facilities use carbon adsorption exclusively to treat wastes. Technical and economic justification of using carbon adsorption to treat these wastes must be based on pilot plant evaluations. The adsorption theory described by rate equations and distinct breakthrough curve geometry can apply to complex wastewaters. Carbon capacity determined from continuous-flow column studies was 10-80% greater than predicted by batch isotherm tests. Series biological-carbon systems probably are the most common carbon application for refinery/petrochemical wastewater treatment. Pilot studies indicated persistent 'leakage' of biochemical oxygen demand organics when fixed-bed carbon columns were applied as a single treatment. More pronounced breakthrough curves and smaller adsorption zone depths were observed for carbon adsorption removal of total organic carbon and chemical oxygen demand when biologically treated effluent was used as column feed compared to primary (oil separator) effluent feed. Carbon capacity in a fixed-bed column increased as influent organic concentration decreased. Breakthrough/exhaustion capacity decreased as wastewater complexity, resulting in unused carbon in the column when breakthrough occurred. Biological-carbon and total carbon systems capable of producing effluents acceptable for selective reuse providing total dissolved solids, chlorides, and certain heavy metals are not concentrated to prohibitive levels. (Buchanan-Davidson--Wisconsin)

Identifiers: *Refinery effluents, *Stripping towers, Sulfur recovery, Atlantic Richfield, Houston Refinery.

The sour water stripper can remove as much as 50% of the oxygen consuming wastes present in refinery effluent water. Sour waters normally constitute 5-15% of the total refinery wastewater flow. The process described strips ammonia and hydrogen sulfide. Sour waters are segregated in a holding tank then fed to a stripping column using steam stripping medium. The unit will generally include a feed drum, stripping column, and associated equipment. Careful consideration must be g

ur water gathering system, design and selec-
f the sour water stripper unit equipment, cor-
n and salt deposits, and disposition of the
er overhead gas release. The disposal usually
ves ammonia recovery and acid gas feed to
lfur recovery facilities. Feeding of ammonia
the sulfur plant is less costly, but involves
ical problems. However, pilot and plant scale
s have shown good results in eliminating
er off-gas in the sulfur recovery plant's con-
section. At the Atlantic Richfield Houston
ery sour water stripper, the cost was mostly
the stripping and heating of steam fed to the
. The effect of sour waters on wastewater
y, and capital and operating costs are shown.

ifiers: *Cheese processing wastes, *Bio-Disc ss, De Pere(Wis).

The Eiler Cheese Company, De Pere, Wisconsin, installed a Bio-Disc unit to treat their processing wastes. The treatment consists of a septic and flow equilization unit; a four-stage Bio-Disc unit with integral clarifier, and a 157,000 gallon, 30-day polishing lagoon. A sequential flow arrangement of septic tanks was designed to receive raw waste, collect dense solids, provide intimate mixing of raw waste and recycled sludge, equalize flow, reduce impact of peak flows, and digest sludge. The Bio-Module was installed 12 ft below ground level and consisted of a feed chamber, four-stage Bio-Disc assembly, and clarifier. Sludge scraped from the clarifier was returned to the septic tanks. Effluent went into the polishing lagoon, then into a stream. This first Bio-Disc installation in the U.S. has an excellent capacity for biological treatment of dairy wastes. Despite poor biodegradation efficiencies of the anaerobic pre-treatment system, 95% overall organic reduction and effluent BOD levels less than 10 mg/l were obtained. It could compensate for an acid waste feed and continue to provide organic reduction. Under high hydraulic and organic loads, it sustained high performance levels and operated efficiently during severe climatic conditions. It maintenance and operating costs are low. INVESTIGATION RELATED TO PREVENTION AND CONTROL OF WATER POLLUTION IN THE U.S. TNT INDUSTRY,
Edgewood Arsenal Aberdeen Proving Ground, Md. Chemical Lab.
D. H. Rosenblatt.
In: 'Pollution: Engineering and Scientific Solutions,' E. S. Barrekett, editor. Proceedings of the First International Meeting of the Society of Engineering Science, June 12-17, 1972, Tel Aviv, Israel, p 272-277.

Descriptors: *Explosives, *Water pollution control, *Waste water treatment, *Activated carbon, Adsorption, Chemical wastes, Sulfur, Chemical engineering, Bituminous materials.
Identifiers: *TNT, Sodium sulfite, Nucleophiles, 'Red waters', 'Pink waters', Ammunition plants.

TNT (2,4,6-trinitrotoluene) is produced exclusively in United States government owned facilities. Water pollution from TNT occurs when solid or molten crude TNT is washed with sodium sulfite to remove TNT isomers. Disposal of the intensely colored high-solids spent wash solution ('red waters') is difficult. Also wastes from sources, such as bomb and shell washings, enter streams and rivers where sunlight at alkaline or neutral pH turns them 'pink'. Procedures for treating 'red' and 'pink' waters are reviewed. When nucleophile reactions were studied using 2,4,5-trinitrotoluene in aqueous acetonitrile, the best nucleophiles at pH 7 were dithiophosphate, thiophenolate, alkylxanthate, sulfite, and dithiocarbpiperidide. TNT isomers exhibited consistent decreases of reactivity with nucleophiles in the order, 2,4,5,-, 2,3,4-, and 2,3,6-trinitrotoluene. Convergent synthesis may be possible by nitrating products of nucleophilic displacement on 2,4,5-, 2,3,4-, or 2,3,6-TNT isomers to give 2,4,6-trinitro-3-substituted toluene. The ambient nature of nitrite ion in attacking 2,4-dinitrohalobenzenes was studied. Only activated carbons prepared from bituminous coal were useful in removing TNT from water. Tests showed that critical bed depth is directly proportional to flow rate, part of the sorptive capacity can be regenerated with warm toluene, but the sorptive capacity approached some constant level on repeated use. (Buchanan-Davidson-Wisconsin)

ABATEMENT OF NITROBODIES IN AQUEOUS EFFLUENTS FROM TNT PRODUCTION AND FINISHING PLANTS,
Army Natick Lab., Mass.
L. A. Spano, R. A. Chalk, J. T. Walsh, and C. DePietro.
In: 'Pollution: Engineering and Scientific Solutions,' E. S. Barrekette, editor. Proceedings of the First International Meeting of the Society of Engineering Science, June 12-17, 1972, Tel Aviv, Israel, p 288-297. 7 fig, 2 tab.

Descriptors: *Waste water treatment, *Explosives, *Nitrogen compounds, Neutralization, Adsorption, Polymers, Color, Resins, Activated carbon.
Identifiers: *TNT, Ammunition plants, 'Red water', 'Pink water', Amberlite XAD-2, Filtrasorb-400.

The final step in the TNT manufacturing process is the finishing plant where alpha-TNT is the principal pollutant. To overcome the red discoloration and lower nitrobody concentration discharged to levels below those which are toxic to living organisms, direct absorption of polymeric resins was investigated. Amberlite XAD-2, a resin adsorbent which is a copolymer of styrene and divinylbenzene, adsorbs nitrobodies which contain primarily alpha-TNT. It is especially effective with wash waters which have not been neutralized and have not acquired the pink-amber color resulting from structural changes of alpha-TNT in water. The adsorption effectiveness of Amberlite XAD-2 is comparable to that of Filtrasorb-400 (an activated carbon) for influent throughputs equivalent to approximately 600 adsorbent bed volumes. Chemical regeneration of Amberlite XAD-2 saturated with alpha-TNT is effectively accomplished with acetone, but regeneration of Filtrasorb-400 has not been successful. To effectively remove nitrobodies from wash waters from alpha-TNT finishing processes and load and pack operations, a column of Amberlite XAD-2 should be used to adsorb most of the nitrobodies and color producing constituents in the stream. The effluent should then be passed through a polishing activated carbon bed to remove any residual color. (Buchanan-Davidson-Wisconsin)

WASTE TREATMENT FACILITIES FOR JONES AND LAUGHLIN STEEL CORPORATION, HENNEPIN WORKS,
Jones and Laughlin Steel Corp., Hennepin, Ill. Combustion and Utilities.
L. B. Stoner.
In: Proceedings of the 26th Industrial Waste Conference, May 4-6, 1971, Purdue University, Lafayette, Indiana, Purdue University Engineering Bulletin, Engineering Extension Series No 140, Part 2, p 761-765.

Descriptors: *Waste water treatment, *Water treatment, *Steel, *Industrial wastes, *Industrial water, Recirculated water, Sludge treatment, Oil wastes, Facilities, Acidic water, Illinois, Injection wells, Sludge disposal, Waste disposal.
Identifiers: Hennepin Works(Ill), Pickle liquor.

The Jones and Laughlin Steel Plant at Hennepin, Illinois, was designed to produce cold rolled sheets and galvanized sheet products. A hydrochloric acid pickle line for removal of scale and rust from hot rolled steel bands, cold reducing mill, temper mill, galvanizing line, facilities for slitting, shearing, corrugating, and finishing steel, and auxiliary facilities were built. Water from the Illinois River is pumped and treated to meet these needs. Water from filter backwash, softener regeneration, boiler blowdown, rolling solutions, condensate, and other uses is collected for waste treatment. Special procedures for treating oils,rolling solutions, solids, and sludge are described. Treated water was good enough for reuse. Waste pickle liquor is treated separately and its residues are injected into deep wells. Solids were first dewatered in a

LIBRARY U. OF I. URBANA-CHAMPAIGN

thickener and lagoon but their ultimate disposal proved problematical. Drying beds and soil conditioning were unsuccessful; sludge solidification is presently being tried. Oil disposal by land fill, commercial incineration, road oiling, and scavenger pickup was unreliable; incineration is now being considered. Excellent results on a consistent basis have been produced at this plant but technological changes and proposed effluent standards pose the threat of obsolescence. (Buchanan-Davidson--Wisconson)

WASTEWATER REUSE AND IN-PLANT TREATMENT,
Ashland Oil and Refining Co., Ky.
R. Willenbrink.
Water-1973, American Institute of Chemical Engineers Symposium Series, Vol 70, No 136, p 671-674, 1973. 3 fig.

Descriptors: *Water reuse, *Waste water treatment, *Oil industry, Kentucky, Water conservation, Phenols, Hydrogen sulfide, Ammonia, Condensers, Organic wastes, Oil wastes, Effluents, Pre-treatment(Water).
Identifiers: *Refineries.

Spent phenolic and sulfide caustic streams; foul water containing hydrogen sulfide, phenol, and ammonia; and vacuum tower jet condenser condensate constitute the bulk of soluble organic waste material generated in refineries and are of particular concern to the Ashland Oil Company, Ashland, Kentucky. Generation of phenol, ammonia, hydrogen sulfide, oil, and other similar contaminants is described and present methods of removing or treating them are discussed. The foul water reuse system, spent caustic disposal system, vacuum tower jet condenser condensate system, waste oil handling system, and in-plant phenol treatment system are described. The method used to handle waste oil at the Ashland's Catlettsburg Refinery is decribed. Pilot tests on foul water stripper effluent and desalter water draw have been discouraging. Before refineries modify or add to their waste water treatment system, they should determine what can be done to reduce waste water flow and contaminant concentrations. Improvement made in the process areas of existing plants will help meet stream standards and minimize final waste treatment costs. (Buchanan-Davidson--Wisconsin)
W76-02448

INDUSTRIAL WASTEWATER RECLAMATION,
Resources Conservation Co., Renton, Wash.
T. M. Fosberg.
Water-1973, American Institute of Chemical Engineers Symposium Series, Vol 70, No 136, p 534-538, 1973. 3 fig, 1 tab.

Descriptors: *Reclamation, *Industrial water, *Waste water treatment, *Water reuse, Design, Texas, Vapor compression distillation, Cooling towers, Evaporators, Ponds, Brines, Solar distillation.
Identifiers: *Cooling tower blowdown, El Paso Natural Gas Co.(Texas), Resources Conservation Co.(Wash).

The Resources Conservation Company of Renton, Washington uses the vapor compression evaporation principle to treat industrial waste water. Basic components of the system are heat transfer surfaces, an evaporator body, and a brine recirculation pump. The waste water reclamation plant installed at the El Paso Natural Gas Company, Texas, has a two-stage evaporator. The first stage concentrates cooling tower blowdown 14 times, yielding 29.5 gpm product water and a waste of approximately 2.5 gpm, which is fed to the second stage. The second stage concentrates the waste an additional 8 times for a total concentration of about 110 times. The high quality product water, which contains less than 10 mg/l total dissolved solids, is returned to the cooling towers. Waste brine flows into a solar evaporation pond, where the remaining water is evaporated. Cooling tower blowndown (evaporator feed) contains silica, calcium sulfate, and bicarbonate. Bicarbonate is removed by adding sulfuric acid. Scale formation is prevented by maintaining a seed slurry in each evaporator. The system is powered by electricity using 90 KWH/1000 gallons of product water. Low operating costs of the evaporator plus recovery and conservation of water minimizes water pollution control costs. (Buchanan-Davidson--Wisconsin)

MICROBIAL ENHANCEMENT OF PHOSPHORUS REMOVAL IN SLUDGE SEWAGE SYSTEMS,
Arizona Univ. Tucson. Dept. of Microbiology and Medical Technology.
C. F. Russ.
Ph.D. Dissertation, 1975, 56 p, 8 fig, 2 tab, 34 ref.

Descriptors: *Waste water treatment, *Sewage treatment, *Biological treatment, *Sewage bacteria, *Sludge treatment, *Phosphorus, Activated sludge, Microbial degredation, Sanitary engineering, Sewage, Water quality, Nutrient removal, Sludge, *Arizona, Water temperature, Hydrogen ion concentration, Biological properties, Water pollution, Ammonia, Nitrogen, Bacteria.
Identifiers: *Acinetobacter phosphadevorus, Tucson Sewage Treatment Platn(Arizona).

A developed sludge produced from filtered primary effluent from the sewage treatment plant in Tucson, Arizona and an organism (Acinetobacter phosphadevorus) isolated from sludge obtained from the Rilling Road Sewage Treatment Plant, San Antonio, Texas, has the capability to remove 80 percent of the phosphorus normally present in Tucson sewage in 8 hours, (most activated sludge-sewage treatment plants have a capacity to remove only 2 to 3 precent of the phosphorus). The optimum temperature range for growth of A. phosphadevorus and phosphorus uptake was from 27C to 37C in sewage broth and 27C in acetate broth. Optimum pH was 7.5 to 8.0 in sewage broth an 7.5 in acetate broth. The organism was shown to derive its nutrient from the volatile acid fraction of sewage and could use ammonium ions as a sole source of nitrogen. Phosphorus removal and growth, both in developed sludge and A. phosphadevorus cells, was inhibited by sodium azide, 2, 4-dinitropheno, sodium iodoacetate, and p-chloromecuribenzoic acid (compounds which affect oxidative phosphorylation, substrate level phosphorylation, sulfhydryl enzymes and membrane premeability). ST. ANNE'S (BOARD MILL LTD., ENGLAND) CLEANS UP THE RIVER AVON.
Pulp and Paper International, Vol 17, No 9, p 44-45, August 1975, 1 fig, 1 illus.

Descriptors: *Waste water treatment, *Pulp wastes, Wastes, Industrial wastes, Water pollution sources, Water pollution treatment, Flocculation, Aerated lagoons, Filtration, Sludge treatment, Suspended solids, Water reuse, Recycling, Water conservation, Polyelectrolytes, Water pollution control, *Treatment facilities.
Identifiers: Alum, Dorr-Oliver Clariflocculators, Dorr-Oliver sludge thickener, England.

The effluent treatment plant at the company's Bristol mill is described. It consists of two Dorr-Oliver Clariflocculators, a Dorr-Oliver sludge thickener, aeration lagoon, and sludge filter. The raw effluent containing an average of 600 ppm of suspended solids (with peaks up to 1000 ppm) is treated with alum and lime before entering a flash mixer. Polyelectrolyte is added immediately after the mixer to induce flocculation and the effluent flows to the Clariflocculators. Clarified effluent from the Clariflocculators flows to the lagoon million liter capacity), from the lagoon clarified effluent is discharged to the river v cascade spillway. Provision is made for recyc some of the clarified effluent to the mill suspended solids content of the final effluen less than 30 ppm. (Witt-IPC)

Identifiers: Sulfite pulp mills.

Current waste water handling practices at the Angeles (Washington) Division of ITT Rayon an ammonia-base sulfite mill producing a rang fully bleached pulp grades, are described. sewer collects waste waters having relatively suspended-solids content, mainly from the w processing and pulping areas; the other coll mill effluents of relatively low suspended-so content, mainly wastes from the bleac sequence. The high-solids sewer discharge treated in a primary clarifier and mixed with low-solids discharge. An oxygen-activated slu effluent system (OASES) for secondary treatm has been evaluated. The trailer-mounted OA pilot-plant reactor has a nominal mixed-liq capacity of 650 gal and consists of five gastigh terconnected 130 gal vessels equipped with face aerators. A clarifier is mounted outside trailer. From data collected over a 3.5 mo period, it was learned that the average 5-day B removal rate was 90%. Overall oxygen consu tion averaged 1.3 lb/lb of BOD removed. (Sy IPC)

**RENT STATUS OF PAPER
OCESSING EFFLUENT CHARAC-
STICS AND DISPOSAL PRACTICES,**
nal Council of the Paper Industry for Air and
n Improvement, Inc., Medford, Mass.
Gove, and J. J. McKeown.

TAPPI Secondary Fibers (and) Testing Conference, Madison, Wisconsin, Sept 16-18, 1975, Preprinted Proceedings (TAPPI, Atlanta, Georgia), p 17-29, 8 fig, 2 ref, 9 tab.

Descriptors: *Waste water treatment, *Pulp wastes, Pulp and paper industry, Effluents, Industrial wastes, Wastes, Water pollution sources, Water pollution treatment, Biological treatment, Biochemical oxygen demand, Suspended solids, Activated sludge, Aerated lagoons, Water pollution control, Water pollution, Regulation.
Identifiers: *Waste paper, Deinking, Deinking mills, Best practicable treatment.

Effluent characteristics of mills utilizing secondary fiber (waste paper) depend on the type of furnish used as raw material for pulp manufacture, deinking processes employed, water reuse within the process, and properties of the end-product, and thus are highly variable. Because of the high organic strength of raw waste materials from deinking mills, biological treatment is generally required to attain acceptable BOD and total suspended solids levels. Activated sludge and aerated stabilization basin processes are currently being employed to treat mill effluents, but results obtainable with available control technology do not demonstrate the levels of proposed national effluent limitations. (Sykes-IPC)

SELECTING A MILL EFFLUENT TREATMENT SYSTEM--SOME CONSIDERATIONS,
D. R. Johnson.
In: TAPPI Engineering Conference, Toronto, Canada, Sept. 28-Oct. 2, 1975, Preprinted Proceedings (TAPPI, Atlanta, Georgia), p 61-68, 4 fig, 3 tab.

Descriptors: *Pulp wastes, *Aerated lagoons, *Activated sludge, *Waste water treatment, Operation and maintenance, Waste treatment, Water pollution treatment, Biological treatment, Pulp and paper industry, Biochemical oxygen demand, Suspended solids, Water pollution control, Treatment facilities, Seasonal, Climates.

The basic operating characteristics of activated sludge systems and aerated lagoons are identified, and the advantages and disadvantages of each system for treating pulp and paper mill effluents are outlined and discussed. Both systems produce treated effluents of comparable quality with respect to BOD and suspended solids. However, the aerated lagoon is simpler to operate and is not as prone to erratic behavior as the activated sludge system. Aerated lagoons find their best application in areas characterized by mild winters and hot summers. Activated sludge system operation is unrelated to climatic conditions. (Witt-IPC)

Identifiers: Beloit Passavant filter press, Nichols-Herrishoff furnace, Kraft mills.

A detailed description is given of the effluent treatment system at Gulf States Paper Corporation's Tuscaloosa, Alabama, kraft mill. The effluent is first clarified in a primary clarifier to settle suspended solids, treated in an oxygenaided activated sludge system to remove BOD, decolored by reacting with alum-mud, and finally clarified to remove the organic precipitate. The sludges from the primary clarifier, activated sludge reactor, and tertiary clarifier are combined and dewatered on a Beloit Passavant filter press, and the resulting high-solids sludge is incinerated without auxiliary fuel in a Nichols-Herrishoff furnace. The ash from the furnace is treated with sulfuric acid to recover alum-mud for reuse. Engineering aspects and capital costs of the plant, problems encountered, performance to date, and operating costs are discussed. (Witt-IPC)

AERATION-STABILIZATION WASTE TREATMENT: A CASE HISTORY,
Hoerner Waldorf Corp., Roanoke Rapids, N.C.
E. R. Hinson, and F. I. Fansler, Jr.
In: TAPPI Engineering Conference, Toronto, Canada, Sept. 28-Oct. 2, 1975, Preprinted Proceedings (TAPPI, Atlanta, Georgia), p 53-60, 5 fig.

Descriptors: *Pulp wastes, *Waste water treatment, *Treatment facilities, Aeration, Oxidation lagoons, Water purification, Industrial wastes, Wastes, Water pollution sources, Water pollution treatment, Water pollution control, Operation and maintenance, Construction, North Carolina, Southeast U.S., Pulp and paper industry, Biochemical oxygen demand, Suspended solids, Sludge treatment, Sewage treatment.
Identifiers: Kraft mills.

Details are given of the development, construction, operation, and performance of the waste water treatment plant at Hoerner Waldorf Corporation's unbleached kraft mill at Roanoke Rapids, North Carolina. The system was put into operation in May of 1974. It features primary clarification and sludge ponding, and secondary treatment in an aerated lagoon and natural stabilization basins. In-plant changes were made to reduce water consumption and raw waste loads. Performance of the system to date has been good. BOD and total suspended solids reductions have exceeded the design criteria of 85% for BOD and 80% for suspended solids. Some of the operating problems encountered are discussed. (Witt-IPC)

PERFORMANCE HISTORIES OF BOILER FEEDWATER PLANTS HIGHLIGHT THE ADVANTAGES OF REVERSE OSMOSIS,
Ecodyne Corp., Union, N. J.
D. J. Butterworth, and W. C. Bass.
In: TAPPI Engineering Conference, Toronto, Canada, Sept 28-Oct 2, 1975, Preprinted Proceedings (TAPPI, Atlanta, Georgia), p 191-195, 7 fig, 2 tab.

Descriptors: *Boiler feed water, *Reverse osmosis, *Water treatment, Membrane processes, Costs, Capital costs, Operating costs, Industrial water, Water quality, Pre-treatment(Water), Water quality control, Quality control, Separation techniques.

Industrial plants utilizing boilers for generating process steam and electrical power consume large volumes of high-purity feedwater. Ion-exchange costs for boiler feedwater have risen sharply due to increased construction costs, scarcity and price of chemicals, and environmental discharge problems. Production and technical advances in reverse osmosis have countered inflationary trends, making the process competitive for many boiler feedwater requirements. Operating data for plants using reverse osmosis (in comparison to conventional ion-exchange) show large cost savings, particularly in chemicals consumed, and reduced waste discharge. Performance histories

highlight key areas for justifying the application of reverse osmosis in new or existing industrial plants based upon benefits in operating costs, installed costs, reliability, and waste discharge. (Witt-IPC)

Identifiers: Paper towels, Toilet tissue, Secondary fiber mills, Waste paper, Tissue papers, Tissue mills, Towel paper.

Ponderosa Paper Products, Inc., is a 40 ton/day mill producing paper toweling and toilet tissue from recycled paper (ledger and manila paper and newsprint wastes). The waste water treatment system which produces water for plant reuse is described. Plant waste water is collected at a central point and treated in a dissolved-air flotation unit to remove settleable and floating solids. The clarified water is then aerated in a 3-section 2.2-million-gallon lagoon. Mechanical surface aerators provide oxygen to the first two sections as required; mixed liquor then flows into the quiescent zone for settling. From the lagoon storage basin, the effluent is polished in two automatic granular-media filters to remove additional suspended solids. The filtered effluent is pumped to a water tower for reuse in the mill. Some operating problems and plans for improving the waste treatment system are discussed. Fresh water consumption at the mill has been reduced from 500,000 to 30,000 gallons/day. (Witt-IPC)

A MILL, A RIVER, AND B(EST) P(RACTICABLE) T(REATMENT),
Thilmany Pulp and Paper Co., Kaukauna, Wis.
A. H. Martin.
In: TAPPI Engineering Conference, Toronto, Canada, Sept 28-Oct 2, 1975, Preprinted Proceedings (TAPPI, Atlanta, Georgia), p 179-184, 1 fig, 2 ref, 2 tab.

Descriptors: *Pulp wastes, *Waste water treatment, *Treatment facilities, Wastes, Industrial wastes, Water pollution sources, Waste treatment, Wisconsin, Water purification, Aerated lagoons, Activated sludge, Biological treatment, Water pollution treatment, Water pollution control, Hydrogen ion concentration, Costs, Capital costs, Operating costs, Energy, Oxygen, Legislation, Regulation.
Identifiers: Kraft mills, Best practicable treatment.

The steps taken by Thilmany Pulp and Paper Co.'s integrated kraft pulp and paper mill (Kaukauna, Wisconsin) in arriving at the waste water control technology to be used to meet the best practicable treatment requirements are described. Effluent treatment at the mill before best practicable treatment, evaluation studies of treatment systems potentially capable of complying with best practicable treatment requirement, and events leading to best practicable treatment selection are discussed. The best practicable treatment selected consists of primary clarification of paper mill effluents, treatment of pulp mill effluents in an aerated lagoon, treatment of the combined clarifier and lagoon effluents in an oxygen-aided activated sludge system, secondary clarification with sludge recycle to the activated sludge reactor, treatment of secondary clarifier effluent in a detention lagoon, and pH control of the final effluent. The impact of environmental costs (capital, operating, and energy) on the profit to assets ratio is also discussed. (Witt-IPC)

NEW METHOD FOR THE PURIFICATION OF INDUSTRIAL EFFLUENTS CONTAINING SULFIDES, POLYSULFIDES, METHYL MERCAPTAN, DIMETHYL SULFIDE, AND DIMETHYL DISULFIDE, BY CATALYTIC DEGRADATION WITH REDUCING IRON,
K. Popov.
Trudove na Nauchnoizsledovatelskiya Institut po Vodosnabdyavane Kanalizatsiya i Sanitarna Tekhnika, Vol 8, No 2, p 113-134, 1973. 1 fig, 2 tab.

Descriptors: *Sulfur compounds, *Waste water treatment, *Catalysts, *Chemical degradation, Sulfides, Wastes, Industrial wastes, Water pollution sources, Water pollution treatment, Catalysts, Iron, Hydrogen, Chemical reactions, Effluents, Laboratory tests, Temperature, Time, Oxidation.
Identifiers: Polysulfides, Methyl mercaptan, Dimethyl sulfide, Dimethyl disulfide, Turpentine.

The proposed method for the purification of effluents containing sulfur compounds is based on the degradation of the latter by the catalytic action of reducing iron. This catalyst is obtained from rusted iron waste by reduction at high temperature with hydrogen or a gas containing hydrogen, e.g., coke gas. Finely dispersed iron has the capacity to dissolve hydrogen at high temperature with the formation of active iron hydrides. Laboratory experiments with this catalyst were conducted on waste waters from the turpentine and evaporation plants of the Kiradzhiev mill in Novi Krichim. The reaction was conducted in tightly closed vessels and with mixing. Important factors affecting the course of the reaction are the temperature, the amount of catalyst, and the time of contact. A 100% oxidation of sulfur compounds was obtained at 10 g catalyst/cu m, at room temperature, and a contact time of 1 hr. The catalyst could be reused four times without significant loss of activity. Its regeneration involves exposure to air and reduction of the iron oxides formed with hydrogen. An industrial process and equipment, which is described, has been developed on the basis of results obtained. The mechanism of the reactions taking place on the reducing iron catalyst are not well understood, but are presumed to be similar to those taking place on a Raney catalyst. The probable mechanisms of the reactions of the catalyst with the sulfur compounds and with the residual turpentine components emulsified in the effluent are discussed. (Stapinski-IPC)

STABILITY OF LIGNINS IN SULFITE MILL WASTEWATERS TO BIOCHEMICAL OXIDATION (ZUR STABILITAET VON SULFITZELLSTOFF- ABWASSERLIGNINEN GEGENUEBER BIOCHEMISCHER OXYDATION),
G. Otto, and H. Schmidt.
Zellstoff und Papier, Vol 24, No 7, p 198-201, July, 1975, 3 fig, 6 ref, 2 tab.

Descriptors: *Sulfite liquors, *Lignins, *Oxidation, *Pulp wastes, Industrial wastes, Water pollution sources, Water pollution treatment, Stability, Color, Chemical oxygen demand, Biological treatment, Aeration, Waste treatment, Waste water treatment, Algae, Biodegradation.
Identifiers: Sulfite pulp mills, Spent sulfite liquors.

Biologically purified sulfite mill effluents were postaerated, 100 days for spruce spend sulfite liquor, 200 days for beech spent sulfite liquor. The decreases in characteristics such as color and COD were from 13 to 19%. Since part of thi
rification effect is due to removal of non-l
materials, it is concluded that the color-prod
lignins and substances related to lignin have a
stability to oxidation, at least under condi
where abundant growth of green algae can be
out. (Ward-IPC)

Identifiers: Neutral sulfite semichemical pul
NSSC pulp mills, Bulgaria, Semichemical
mills.

At the Kiradzhiev paper mill in Bulg
semichemical pulp is produced from oak-
beechwood by the neutral sulfite process. Th
fluents from the digester room have a pH of
an average suspended solids content of 690
m, an average 5-day BOD of 545 g/cu m, an
average COD of 1300 g/cu m. The correspo
figures for the effluents from the pulp-d
machine are 6-7.5, 970, 1145, and 2160. Ex
ments were conducted with the overall effl
from the mill to determine the possibility of
purification in aeration tanks. Following the n
sary dilution, the needed phosphorus and nitr
were added either in the form of municipal se
or by the addition of superphosphate and amm
um sulfate according to a 5-day BOD:N:P ra
100:5:1. Prior to biological treatment
suspended solids were partially removed by f
tion to a residual content of 100 g/cu m. Acco
to data obtained for an aeration tank of 12
capacity, the reduction of BOD is about 85%
load of 1000 mg BOD/cu m/day. The purifie
fluents retain their initial dark brown color
have a COD of 200 g/cu m, on the average. Th
dicates a high content of unoxidized organic
pounds, probably mostly lignin. It is suggested
effluents from mills located in cities (e.g., the
mill in Sofia) be purified jointly with muni
sewage. In other mills, they can be pur
separately after the addition of neces
nutrients. (Stapinski-IPC)

ifiers: Pyrolysis, Filter presses.

mmendations from the Phase 1 Technical Rehat led to the development of the New York- Jersey Metropolitan Area Sewage Sludge sal Management Program are reported. e a limited quantity of sludge may be disposed land application, the best alternative to land ean sludge disposal is dewatering by filter es followed by pyrolysis. The choice of best sal method was based on environmental imeconomic feasibility, and energy recovery. It suggested that ocean disposal, which is used sively in the New York-New Jersey area, d be phased out and that multiple hearth inators which could be converted to pyrolysis should be implemented. Due to potential air tion, finding sites for incineration might be ult. The total costs of facilities to handle 2000 of sludge by the year 200 has been estimated 0 to $500 million in current dollars. LANDFILL STABILIZATION WITH LEACHATE RECYCLE,
Georgia Inst. of Tech., Atlanta. School of Civil Engineering.
F. G. Pohland, and P. R. Maye.
In: Third Annual Environmental Engineering and Science Conference, March 5-6, 1973, Louisville, Kentucky, p 389-412, 15 fig, 3 tab. EPA R-801397.

Descriptors: *Landfills, *Stabilization, *Leachate, *Recycling, Biodegradation, Return flow, Moisture, Waste water treatment, Organic acids, Hydrogen ion concentration.

Sanitary landfill stabilization is largely dependent on biological activity for decomposition of organic materials. To demonstrate the advantages of leachate collection and recycling in accelerating stabilization of sanitary landfills, simulated landfills were constructed and filled with compacted refuse, comparable to municipal domestic solid wastes. Studies for 600 days indicated that leachate recirculation established an active biological population more rapidly than in the control system, causing an increased stabilization rate and decreasing the time of biological stabilization of readily available organic matter. The column was an effective treatment system for its own leachate, reducing the concentration of pollutants discharged. Control BOD, COD, and TOC levels rose then declined slowly; in the recirculating unit, they rose, then decreased rapidly to much lower values, and, volatile acids rose initially, then were converted to methane and carbon dioxide. Leachate pH was low at first, but returned to neutral rapidly. Alkalinity was lowest when volatile acids were high, and vice versa. Less organic and ammonia nitrogen were available in recycled leachate. The test results provide a basis for more accurate estimation or prediction of effects on the environment, leachate control, and opportunities for the ultimate use of landfill sites. 5F. Water Treatment and Quality Alteration

SAFE DRINKING WATER ACT.
Public Law 93-523, 93rd Cong, December 16, 1974. 34 p.

Descriptors: *Potable water, *Supervisory control(Power), *Water quality control, *Water quality standards, *Public health, Administrative agencies, Administrative decisions, Decision making, Federal government, United States, Administration, Legal aspects, Governments, Jurisdictions, Water quality, State governments, Water pollution, Safety, Adoption of practices, Coordination, Regulation.
Identifiers: *Environmental Protection Agency, *Contaminant levels, Civil actions, Administrative regulations, Citizen suits, Enforcement, Health.

This Act amends the Public Health Service Act to assure that the public is provided with safe drinking water. The Act, with certain exceptions, applies to each public water system in each state, although primary enforcement responsibility remains with the states. The Act provides that the Administrator of the Environmental Protection Agency shall publish proposed national interim primary drinking water regulations covering recommended maximum contaminant levels as determined by the National Academy of Sciences. Timetables and guidelines are set out by which the Administrator is to determine state compliance. If he deems in necessary, the Administrator has emergency powers to protect the health of persons endangered by contaminants in any public water system. Other provisions include: (1) variances, hearings and penalties; (2) chemical supplies necessary for water treatment; (3) research and technical assistance; and (4) commencement of civil suits either by the Administrator or by private citizens for violations of drinking water standards under this title. (Parrish-Florida)

SAFE DRINKING WATER ACT PL93-523--(LEGISLATIVE HISTORY).
US Code Cong and Admin News, p 6454-6506, 1974, 53 p.

Descriptors: *Potable water, *Domestic water, *Water purification, *Standards, *Public health, Water quality, Legislation, Regulation, Law enforcement, Penalties(Legal), Water quality, Federal jurisdiction, State jurisdiction, Grants, Research and development, Taste, State governments, United States, Federal government, Adoption of practices, Underground streams, Water sources.
Identifiers: *Safe Drinking Water Act, Public water systems.

The purpose of this legislation is to assure that water supply systems serving the public meet minimum national standards for protection of public health. In contrast to existing legislation, this bill would authorize the Environmental Protection Agency (EPA) to establish federal water quality standards applicable to all public water systems. The bill would also establish a joint Federal-State system for assuring compliance with these standards and for protecting underground sources of drinking water. The EPA would be responsible for issuing primary regulations concerning maximum allowable contaminant levels. In addition, the EPA would issue regulations specifying the criteria and procedures necessary to assure compliance with drinking water standards. The bill would further provide for Federal grants to assist State surveillance and enforcement programs under this legislation. States which adopt and implement adequate standards and enforcement measures are authorized to grant variances from national regulations, and to grant exemptions extending the time for compliance by any public water system. In giving States the authority, the bill reflects a desire for more flexible and effective implementation at local levels. Supplementing the bill are comments received by the Committee on Interstate and Foreign Commerce from various governmental agencies concerning its passage. (Hoffman-Florida)

Sachs-Systemtechnik G M. b. H., Schweinfurt (West Germany), (assignee).
V. Eibl, and A. Reis.
U.S. Patent No 3,910,829, 3 p, 1 fig, 3 ref; Official Gazette of the United States Patent Office, Vol 939, No 1, p 337, October 7, 1975.

Descriptors: *Water treatment, *Patents, *Disinfection, *Water purification, *Water quality control, *Water pollution treatment, *Oxydation, Electrodes, Anodes, Cathodes, Electric currents, Waste water treatment.
Identifiers: Detoxication.

A method of purifying an aqueous liquid contaminated with microorganisms is disclosed. The method consists in exposing the liquid to be disinfected to a reducing agent before the treatment in the electrolytic cell, i.e., enriching the liquid with electrons. If the cathode compartment of an electrolytic cell is used as the reduction agent it is not necessary to add any reagents to the liquid so as to obtain a reduction effect. It is of some advantage to make such an arrangement so that a number of electrolytic cells are passed subsequently, whereby the liquid flows through the cathode compartment of the first cell and through the anode compartments of the following cells. The cells are arranged in series such that the outlet from the cathode compartment of one cell is connected to the inlet of the anode compartment of another cell and so on. (Sinha-OEIS)
W76-02251

TWIN BELT ION EXCHANGE SYSTEM,
E. L. Karlson.
U.S. Patent No 3,910,842, 5 p, 6 fig, 4 ref; Official Gazette of the United States Patent Office, Vol 939, No 1, p 341, October 7, 1975.

Descriptors: Patents, *Ion exchange, *Water treatment, *Separation techniques, *Demineralization, *Water purification, *Water quality control, Anion exchange, Cation exchange, Resins.

The primary object of this invention is provde a system for deioninzing a solution by the belt method while employing a single treatment tank. A pair of endless belts are employed, one belt has incorporated into its construction an anion exchange resin and the other belt has so incorporated a cation exchange resin. Both belts are passed through the flowing solute in a direction opposite to its flow while simultaneously making a number of traversals perpendicular to the fluid flow. All the fluid is caused to pass through each belt a number of times. The fluid is thereby substantially deionized. Upon leaving the flowing liquid, the anion belt is passed through an anion resin regeneration tank where it is stripped of its captured anions and regenerated prior to returning to the fluid under treatment. The cation belt similarly is removed from the fluid under treatment and passes to a cation resin regenerating tank where it is similarly stripped of captured cations and regenerated prior to return to the fluid. ifiers: *Hazardous substances.

972 the United States and Canada signed the t Lakes Water Quality Agreement, thereby eing to develop and implement programs ied necessary to restore and enhance water ty in the Great Lakes System. The Interna- l Joint Commission (IJC) was directed to t the Governments in implementing the ement. This report provides the basic infor- on required by the IJC to make its report to overnment on progress during 1974 in achiev- ie objective of the Agreement. Data and con- ons based on that data are presented on a ber of topics involving the Great Lakes re- including: (1) water quality assessment; (2) cipal pollution abatement; (3) eutrophication phosphorous control; (4) industrial pollution ement; (5) institutional activities; and (6) r quality objectives. Information is also ented on other subjects such as dredging, land activities, shipping, onshore and offshore ties, joint contingency plans and hazardous ting substances. An annex to the report ents the specific water quality objectives for oundary waters of the Great Lakes System. fman-Florida)

DEGRADATION OF WATER QUALITY: NEED FOR EFFECTIVE ACTION,
nyder.
e Dame Lawyer, Vol 50, p 890-909, 1975, 20 9 ref.

riptors: *Federal Water Pollution Control *Degradation, *Water quality control, mnistration, *Water pollution control, slation, Decision making, Administrative cies, Water quality standards, Regulations, line studies, Water policy, Programs, At- es, Water quality, Classification, Bodies of r, Control systems, Adoption of practices. tifiers: *Nondegradation, Guidelines.

ondegradation program is aimed at keeping water clean. Without an effective non- adation program, polluters may in- riminately pollute clean waters without regu- n until the water reaches minimum water ty standards. The Environmental Protection ncy (EPA) is criticized for not instituting a ive nondegradation policy as it is authorized under the Federal Water Pollution Control (FWPCA). For example, no water quality lards have ever been issued by the EPA to en- nondegradation policies. So far the only ished EPA pronouncements on nondegrada- tion have been its Water Quality Strategy Papers. While these papers have identified the key elements of a nondegradation policy, they are only intended as guidelines and thus have no legal force. Even if these guidelines had legal force, they would still be of little value since they provide no guidance for implementation. The National Resources Defense Counsel has proposed a nondegradation program detailing procedures for classifying waters according to the degree of permissible degradation. The enforcement of this program would center on a permit system whereby dischargers would have the burden of showing that their proposed discharge does not violate prescribed standards. AIR AND WATER QUALITY STANDARDS IN FLORIDA,
Florida State Dept. of Environmental Regulation, Tallahassee.
P. Baljet.
Florida Environmental and Urban Issues, Vol 11, No 6, p 9-10, 17 Aug, 1975, 3 p, 2 illus.

Descriptors: *Water quality standards, *Florida, *Waste disposal, *Saline water, *Water pollution control, *Sewage disposal, Salinity, Water pollution sources, Wastes, Effluents, Sewage effluents, Shores, Environmental effects, Outfall sewers, Sewage bacteria, Beaches, Swimming, Eddies, Pathogenic bacteria, Public health.
Identifiers: *Miami Beach(Fla), Gulfstream.

Florida has the strictest environmental standards in the Southeast, but the current economic situation has applied increasing pressure for the relaxation of both air and water standards. In Dade County, for example, the city of Miami Beach discharges sewage into the ocean where circular eddy currents often bring sewage outfalls back onto bathing beaches. Arguments that the Gulfstream is so big that sewage discharge into it is not harmful fail to take stream fluctuations into account. It is only the sterilizing effect of saline water that has prevented greater health problems. However, secondary treatment of ocean outfalls is expensive because of the great quantities of sewage involved. Before costly changes in sewage treatment are undertaken, studies should be made to determine the effects of swimming in saline waters affected by sewage outfalls. (Parrish-Florida)

ALABAMA; NAVIGABEL WATERS (PROPOSED WATER QUALITY STANDARDS).
Environmental Protection Agency, Washington, D.C.
Federal Register, Vol 39, No 138, p 26168-26169, July 17, 1974, 2 p.

Descriptors: *Water quality standards, *Alabama, *Navigable waters, Federal Water Pollution Control Act, *Standards, *Water pollution control, Rivers, Streams, Fish, Wildlife, Water quality control, Governments, Federal government, State government, Administrative agencies, Administration, Water utilization.
Identifiers: *Federal Water Pollution Control Act Amendments of 1972.

Pursuant to the Federal Water Pollution Control Act Amendments, the Environmental Protection Agency (EPA) reviews water quality standards for interstate and intrastate waters adopted and submitted by the states. Alabama has submitted its standards for EPA review, and they have been found to be consistent with the law. Therefore, the Alabama submissions are now the effective water quality standards within the state under Section 303 of the Act. A proposed new section of Alabama's standards provides that certain specific waters classified 'Fish and Wildlife as a Goal' will be excepted from meeting water quality standards as required by Public Law 92-500. Other specified streams are to be reclassified as 'Fish and Wildlife.' (Parrish-Florida)

Federal Register, Vol 40, No 18, Part 11, p 4102-4113, January 27, 1975, 12 p.

Descriptors: *Phosphates, *Industrial wastes, *Effluents, *Water pollution control, Water pollution sources, Chemical wastes, Liquid wastes, Water quality standards, Technology, Penalties(Legal), Economic impact, Regulation, Economic justification, Discharge(Water), Sewage effluents, Water law, Legal aspects, Standards.
Identifiers: Phosphate plants, Point sources of pollution, Effluent guidelines, Administrative regulations, Effluent limitations, Hazardous substances(Pollution).

These regulations set effluent limitations and guidelines for existing sources for the defluorinated phosphate rock subcategory and the sodium phosphates subcategory of point sources in the phosphate manufacturing category. In addition to the regulations, proposed standards of performance for new point sources and pretreatment standards for existing sources and new sources are presented. A summary of conclusions are presented on a variety of aspects including: categorization, waste characteristics, origin of waste water pollutants, treatment and control technology, cost estimates for control of waste water pollutants, and economic impact analysis. Effluent limitations guidelines are given for two categories, with one representing the degree of effluent reduction attainable by the application of the best practicable control technology currently available, and the other representing the degree of effluent reduction attainable by the application of the best available, economically feasible technology. THE AWAKENED INTEREST IN THE SEWER ORDINANCE,
Camp Dresser and McKee, Boston, Mass.
R. H. Culver, and T. Saxon.
In: Proceedings of the 29th Industrial Waste Conference, May 7, 8 and 9, 1974, Part One, Purdue University, Lafayette, Indiana, p 565-573, 2 ref, 2 append.

Descriptors: *Sewerage, *Legislation, *Local governments, *Waste water treatment, Sewers, Industrial wastes, Cost allocations.
Identifiers: *Sewer ordinances.

The promulgation of regulations banning the discharge of untreated wastes has augmented the need for new sewer ordinances in many communities. It is now necessary to limit the discharges to the sewer system to those wastes that can be adequately treated by municipal treatment systems and which are not toxic to the system. In addition, PL 92-500 requires that all applicants for federal assistance in the construction of sewer works have a system of allocation of charges for sewer use. When planning for a new ordinance, decisions must be made on the design capacity of the system, the wastes which will or will not be treated, the administrative and operating body for the works, and the method which will be used to pay for the system. The ordinance should promote the best utilization of the sewer works that will achieve protection of public health, protection of the works, safety for the operating personnel, and efficiency of the treatment process. An ordinance generally consists of five parts. The first section defines all the special terms used in the ordinance and eliminated differences of interpretation that may cause dispute and litigation. A section on the conditions for discharge to the system described who must discharge to the system, and the manner in which the connections are to be made. The last three sections include: the limitations on what may be discharged to the sewer; the powers of the authority to inspect, assign penalties, and prohibit discharges; and, a description of the cost assessments. DEVICE FOR RECOVERING POLLUTING PRODUCTS SPREAD OVER THE WATER SURFACE, IN PARTICULAR OIL PRODUCTS,
Institut Francais du Petrole, Rueil-Malmaison (France). (Assignee).
P. Degobert, F. Kermarrec, and Y. Nadaud.
U.S. Patent No 3,912,635, 4 p, 8 fig, 11 ref; Official Gazette of the United States Patent Office, Vol 939, No 2, p 934, October 14, 1975.

Descriptors: *Patents, Water pollution control, *Oil pollution, *Oil spills, *Water pollution treatment, *Water quality control, Oil-water interfaces, Porous media, Equipment, *Separation techniques, Pollution abatement.

This device is adapted to recover polluting products of a lower density than water and which are immiscible by creating at the water surface a recess for collecting these polluting products. The recess is defined by at least one wall of which at least a portion is porous. The wall portion is made of a hydrophobic material easily wetted by the polluting products and through which these products selectively penetrate into the recess and which forms a barrier against water. The containers maintain the same porous portion at the level of the slick of polluting products floating on the water surface until the container is completely filled up. It is necessary to give the porous portion of the wall the greatest possible height so that the container which sinks progressively into the water as it becomes more filled, can gather a sufficient quantity of polluting products. The containers can be equipped with adjustable ballasting means. (Sinha-OEIS)

Available from the National Technical Information Service, Springfield, Va 22161. Environmental Protection Agency, Report EPA-600/5-75-015, September 1975. 244 p, 44 fig, 48 tab, 34 ref, 7 append. EPA 1HC619. 68-01-2232.

Descriptors: *Monitoring, Standards, Effluents, Water quality control, *Resource allocation, *Michigan, Statistical methods, *Water quality standards, Cost analysis, River basins.
Identifiers: *Effluent standards.

A quantitative method is developed and demonstrated for the preliminary design of effluent standard surveillance systems. A procedure is presented to be used in the state or EPA water quality programs to determine the frequency of effluent compliance monitoring visits. The procedure allocates compliance monitoring budgetary resources so as to minimize environmental damage. It utilizes a statistical model of the effluents that is obtained from self-monitoring and compliance monitoring data. The procedure is demonstrated on an example river basin using data supplied by the State of Michigan. (EPA)

Available from the National Technical Information Service, Springfield, Va 22161. Environmental Protection Agency, Report EPA-660/2-75-026, June 1975. 116 p, 6 fig, 24 tab, 27 ref, 2 append. EPA 1BB045. 802168 (16080 FQV).

Descriptors: *Farm wastes, Nitrogen, Peak, Rice, Nutrients, Phosphorus, Water quality control, Surface waters, Crops response, Consumptive use, Bioassay, Minnesota, Agriculture.
Identifiers: Wild rice culture, Nutrient control, Peat soils, Clearwater River(Minn).

A study was conducted to determine effects on water quality from flooded paddies used for the commercial culture of wild rice, Zizania aquatica. Water samples were taken from flooded impoundments of fertilized peat and mineral soils as well as unfertilized peat soils. Weekly changes in the chemical and physical parameters of water entering, within, and discharged from paddies measured through the summer. No signif changes were observed in the receiving wate fall drawdown occurred when increases in solved solids, total Kjeldahl-nitrogen and phosphorus occurred in the Clearwater R Algal assay tests indicated that the increa nutrients at peak discharge was sufficient crease algal populations. The quantities nutrients released from rice paddies were sig nificantly greater than would be expected in mal runoff in the area and much less than amounts released from most agricultural deavors. Consumptive water use was 20-22 i per acre (51-56 cm/ha). (EPA)

ANALYSIS OF COST SHARING PROGRAMS FOR POLLUTION ABATEMENT OF MUNICIPAL WASTEWATER,
National Bureau of Standards, Washington, D.C. Building Economics Section.
H. E. Marshall, and R. T. Ruegg.
Available from the National Technical Information Service, Springfield, Va 22161 as PB-239 420, $6.00 in paper copy, $2.25 in microfiche. Report No EPA-600/5-74-031, November 1974. 146 p, 10 fig, 11 tab, 73 ref, 1 append. EPA-IAG D4 H 374.

Descriptors: *Cost sharing, *Sewage treatment, *Water pollution control, *Federal government, *Equitable apportionment, *Optimization, Institutional constraints, Use rates, Local governments, Cost allocation, Operating costs, Economics of scale, Capital costs, Grants, Economic efficiency, Treatment facilities, Legislation, Motivation.

The existing federal cost-sharing arrangements for sewage treatment facilities are evaluated for their national efficiency and equity. The study identifies action that would increase the local share of pollution abatement costs; reduce the cost-sharing bias toward capital-intensive and eligible land-intensive projects; reduce the cost-sharing bias for some plant over nonplant techniques; increase the federal and local expenditures on nonplant techniques; increase the community demand for nonplant techniques; and increase the degree of pollution abatement per national dollar spent. Discussed in detail are the existing cost-sharing programs and institutional constraints, cost sharing by other agencies, conditions for efficiency, least cost techniques to the nation, economies of scale, and the characteristics of equity. Also evaluated are effects of user fees on cost shares, legislated user fees and their interpretations, interest charges on user fees, and the implications of fees. The findings are that the same percentage of cost-sharing should be allocated for all waste treatment techniques, the same percentage of cost shares be allocated to all cost categories (operation, maintenance, etc.), the same percentage of cost shares be allotted to communities of all sizes, user fees should be returned to the granting agency, interest should be charged on industrial user fees, and institutional obstacles be eliminated. IMPROVEMENT OF THE ENVIRONMENTAL AND ECONOMIC CHARACTERISTICS OF COOLING TOWERS: PART I OF II. HEAT REJECTION FROM HORIZONTAL TUBES TO SHALLOW FLUIDIZED BEDS,
Massachusetts Inst. of Tech., Cambridge. Energy Lab.
B. R. Andeen, L. R. Glicksman, and W. M. Rohsenow.
Available from the National Technical Information Service, Springfield, Va 22161 as PB-239 440, $7.50 in paper copy, $2.25 in microfiche. Report No MIT-EL 74007 (HTL 80047-85), June 1974. 189 p, 54 fig, 8 tab, 31 ref, 7 append.

Descriptors: *Powerplants, *Cooling towers, *Heat transfer, Heat exchangers, Thermodynamic behavior, Draft tubes, Economics, Particle size, Capital costs, Operating costs, Model studies, Correlation analysis, Transmissivity, Design.
Identifiers: *Heat rejection, Dry cooling towers, Fluidized beds, Waste heat.

The applicability of using fluidized beds as a means of enhancing heat transfer coefficients in air cooled heat exchangers, particularly in power-plant dry cooling towers, is evaluated. Various fludized bed models, as cited in literature, are discussed and an experimental program is described. An economic comparison between a power plant sized finned tube cooling tower and fluidized bed cooling tower is made using an optimized design program. The design considers the most economically favorable heat exchanger by optimizing heat transfer and thermodynamic relations with economic trade-offs. The design routine, give the performance and characteristics dimensions of the heat transfer surface, efficiencies, cost factors, and the yearly atmospheric temperature profile, designs a heat exchanger. The program then minimizes the incremental increase in the average yearly cost of power generation resulting from the use of a dry cooling tower by systematically varying the design of the heat exchanger and the turbine back pressure. The incremental cost represents all costs associated with adding a dry cooling tower to the system and maintaining the same net generating power. The incrementatl cost is figured from various capital costs and maintenance and operating costs. (Auen-Wisconsin)
W76-02381

POLLUTION ABATEMENT AND ECONOMIC GROWTH: AN APPLICATION OF THE VON NEUMANN MODEL OF AN EXPANDING ECONOMY,
Bureau of Economic Analysis, Washington, D.C.
J. E. Cremeans.
Available from the National Technical Information Service, Springfield, Va 22161 as AD-A003 151, $4.00 in paper copy, $2.25 in microfiche. Office of Naval Research, Naval Research Logistics Quarterly, Vol 21, No 3, p 525-542, 1974. 2 fig, 16 tab, 7 ref.

Descriptors: *Gross National Product, *Pollution abatement, Leontief models, Mathematical models, Input-output analysis, Economic impact, Linear programming.
Identifiers: *von Neumann model.

A generalised von Neumann model of an expanding economy allows the production of joint products and the use of alternative processes. Normal economic models include only those commodities produced and sold within the system; outputs with negative effects, such as pollution, 'bads' are ignored as being external to the system. These external outputs can be incorporated as outputs in a model and in many cases production alternatives are available that allow for varying degrees of pollution with production. A von Neumann growth model is applied to these circumstances explicitly incorporating pollution and allowing for alternative processes with varying degrees of pollution output. Difficulties were encountered in applying this approach but the results seem sufficiently worthwhile to continue with its development. The study includes an examination of the relationhsip between pollution reduction and economic growth. Examples used cover direct control of pollution, demand for a reduction in pollution, and using an exogenous constraint to reduce total pollutants produced, includes the calculation of an effluent charge. This approach does allow the effect of pollution abatement on the price structure to be determined directly. (Carpenter-Wisconsin)

FACTORS IN THE ELIMINATION OF THE IMMATURE STAGES OF ANOPHELES QUADRIMACULATUS SAY IN A WATER LEVEL FLUCTUATION CYCLE,
Johns Hopkins Univ., Baltimore, Md. School of Hygiene and Public Health.
E. M. Darrow
American Journal of Hygiene, Vol 50, p 207-235, 1949. 7 fig, 17 tab, 22 ref.

Descriptors: *Mosquitoes, *Immature growth stage, *Water level fluctuations, *Insect control, Reservoirs, Mortality, Southeast U.S., Public health, Larval growth stage, Viability, Climates, Aquatic plants, Soil moisture, On-site investigations, Tennessee Valley Authority, Vectors(Biological).
Identifiers: *Anopheles quadrimaculatus, Malaria, Predators.

Mechanisms of water levels fluctuations to control Anopheles quadrimaculatus, a mosquito malaria vector in Tennessee Valley Authority impoundments were studied. During draw-down, 75-100% of larvae migrated with the receding water. Stranded larvae numbers were inversely proportional to water level recession rate and directly proportional to intersection values in the dewatered area. All stages were equally susceptible to stranding. Daytime mortalities were increased by predators; there was lesser mortality at night. Daytime mortality rates of stranded larvae and pupae correlated closely with evaporation. Exposure to predators and climate for 8 hours on clear summer days killed 92% of larvae and 75% of pupae. Degree of soil moisture was correlated with mortality. Saturated air was more lethal at 31C than 25C. First stage larvae were more susceptible to dessication than fourth stage larvae. Pupae exposed on soil to saturated air survived to eclosion as well as controls kept in water, but the proportion able to transform into adults was only 55-72% of controls. Eggs kept moist for 0.2-0.3 of the total embryonation period acquired resistance to desiccation. At 100% relative humidity eggs continued to develop out of water on a dry substratusm. WATER MANAGEMENT PLANNING FOR MALARIA PREVENTION IN THE DAMODAR VALLEY, INDIA,
Disease Center, Savannah, Ga. Communicable.
J. M. Henderson.
American Journal of Tropical Medicine and Hygiene, Vol 4, No 6, p 1091-1102, 1956.

Descriptors: *Human diseases, *Vectors(Biological), *Mosquitoes, *Asia, Control, Epidemiology, Water resources development, Multiple-purpose projects, Habitats, Irrigation systems, Water level fluctuations.
Identifiers: *India, *Malaria, Damodar Valley Corp.(India), Anopheles.

This multi-purpose program, in West Bengal and Bihar on the Damodar River and its tributaries, includes flood control, irrigation, reservoirs, barrage ponds, a thermal electric plant, a power transmission network, navigation, access highways to the impoundments, and water supply to Calcutta. The malaria transmission season is normally between July and December; 46 species and subspecies of Anopheles have been identified. Anopheles culicifacies and A. philippinensis are the major species. Recommendations for malaria control include clearing of trees and brush within and immediately beyond full pool levels of impoundments, draining depressions in drawdown-refill zones, varying pond water levels, and drawdown and improvement of the Bokaro Pond shoreline. Water form Durgapur Pond will provide supplemental water for rice crops during the monsoon season and will be the primary water supply during the dry season. Irrigation presents a major malaria hazard. There are conflicting opinions as to how to curb 'irrigation malaria'; one suggests raising the water table by excessive irrigation and avoiding drainage; another recommends minimum water application and maximum drainage. Recommendations are made for research on anopheline ecology to evaluate cause and effect relationships between the water table, malaria, and irrigation practices. (Buchanan-Davidson--Wisconsin)

NATURAL BIOLOGICAL CONTROL OF THE SALT MARSH MOSQUITO IN THE ACID MINE DRAINAGE SWAMPS IN WESTERN KENTUCKY,
Speed Scientific School, Louisville, Ky.
H. T. Spencer, C. D. Baker, C. Leuthart, and M. E. Shawler.
In: Fifth Symposium on Coal Mine Drainage Research, October 1974, Louisville, Kentucky, p 172-180, 1 fig, 3 tab, 9 ref.

Descriptors: *Biocontrol, *Salt marshes, *Mosquitoes, *Brackish water, Mine drainage, Swamps, *Kentucky, Aquatic plants, Environmental effects, Insect control, Chara, Dissolved oxygen, Fishes, Dragonflies.
Identifiers: *Aedes sollicitans, Hopkins County(Ky), Clear Creek Swamp(Ky), Button bush, Duckweed, Damselflies, Diving beetles, Predators.

Runoff from deep mines, spoil, and deforestation has created acid swamps covering large areas of western Kentucky. Some tributaries of the Tradewater Basin which had been free-flowing, with definite banks and channels, now cover 10,000 acres of once forested land. Each spring flooding creates an ideal habitat for mosquitoes, especially the salt marsh mosquito, Aedes sollicitans. Major control efforts have been in Hopkins County, which contains most of the Clear Creek watershed. Mosquitoes were epidemic in 1956 when they were controlled by spraying, but now appear under control by the ecosystem. The once turbid water now stays clear permitting extensive Chara blooms in mosquito breeding areas. Chara has a history as a mosquito control agent by increasing dissolved oxygen in the surrounding water; high dissolved oxygen concentration is considered inhibitory to the development of the mosquito larvae. Extensive regrowth of button bush on deforested areas permits duckweed, another mosquito control agent, to flourish. Many insects are mosquito predators, with the more aggressive in great numbers; particularly effective are the dragonfly, damselfly, and diving beetle (Dysticidae). Improved mining and reforestation practices will enhance biological diversity through improved water quality and the continued biocontrol of the Culicidae. (Auen-Wisconsin)

Identifiers: *Anopheles quadrimaculatus, Malar
control.

The Tennessee Valley Authority malaria contr
program is directed primarily at control o
Anopheles quadrimaculatus, the only know
malaria vector in the region. To prevent malari
transmission, naturalistic, chemical, and mechan
cal methods are used; the most important is wate
level management. On main river reservoirs, th
pool is filled into a surcharge zone before th
growing season; a flood surcharge picks up an
strands winter debris. The pool is maintained nea
top summer pool level as long as possible to co
trol marginal plants. Water level is then fluctuate
to disrupt water line vegetation and larval breedin
habitats. Cyclical fluctuation (dropping the leve
one foot and refilling 0.9 foot each week) until th
breeding season ends keeps the water level belo
the encroaching vegetation band. Winter draw
downs every 2-3 years attenuate submersed plan
growth. At Wilson Dam a constant pool size is fol
lowed by weekly cyclical fluctuations of about tw

LIBRARY U. OF I. IRRIANA-CHAMPAIGN

. Management of tributary stream storage rvoirs consists of a constant pool phase fol- ed by seasonal recession. If summertime filling eeded, reservoirs should be full about three ks before recession starts. In areas where er level management has not been completely quate, larvicides and vegetation control opera- s are used as supplementary techniques. chanan-Davidson--Wisconson)

Identifiers: Developing countries, Papaloapan River Basin(Mex), Cost-effectiveness methodology.

Justification for the construction of a water resource project in developing countries has been traditionally based on benefit-cost analysis. This study demonstrates the use and advantages of the cost-effectiveness methodology in a developing country and is applied to water resource development in the Papaloapan River Basin in southeastern Mexico. Project-related social variables are included, and a comparison to traditional benefit-cost analysis is emphasized. The planning process starts by identifying desired goals which are then mapped into specifications. Quantitative and qualitative criteria relating specifications to system capabilities are defined, and the capabilities of district alternative systems are determined and compared. Then, using either a fixed-cost or fixed-effectiveness approach, the alternative system which most closely satisfies goals is selected. The methodology suggests improved ways of defining goals and criteria in developing countries and sets forth a concise framework upon which developing countries may base future water resource planning, design and operation. ESTABLISHING A PROCESS FRAMEWORK FOR LAND USE PLANNING,
Forest Service, (USDA), Berkeley, Calif. Watershed Systems Development and Application Unit.
L. J. Lundeen.
In: Vol 4: Hydrology and Water Resources in Arizona and the Southwest, Proceedings of the 1974 Meetings of the Arizona Section, American Water Resources Association and the Hydrology Section, Arizona Academy of Science, April 19-20, 1974, Flagstaff, Arizona.

Descriptors: *Planning, *Land management, *Land use, *Water resources, Land development, Conservation, Land classification, Land resources, Natural resources, Evaluation, Land appraisals, Systems analysis,Simulation analysis, Social aspects, Decision making, Economics.
Identifiers: *Land use planning.

In order to be effective, the operational aspects of land use planning must be tied to a well defined planning process. The framework for this process includes a set of components which are important in solving planning problems and are linked together in a design related to the basic concepts of decision analysis oriented to natural resource problems. Detailed description can be added to the process framework to adjust it to a specific problem, study area, or study level. Major components in the framework which are discussed include an objectives and goals spectrum, problem formulation, physical characterization of the land, social and economic demands analysis, identification of management alternatives and specific activities, simulation of resource response, allocation of resources, visual quality analysis, transportation system analysis, and a data management system. The basic concept of a systematic, decision-oriented procedure has been recognized as a key factor in effective planning or problem solving. (Robinett-Arizona)

SUMMARY APPRAISALS OF THE NATION'S GROUND-WATER RESOURCES--UPPER MISSISSIPPI REGION,
Geological Survey, Sacremento, Calif.
R. M. Bloyd, Jr.
Available from Supt of Documents, GPO, Wash, DC 20402, price $0.30. Professional Paper 813-B, 1975. 22 p, 8 fig, 9 tab, 26 ref.

Descriptors: *Groundwater resources, *Hydrogeology, *Hydrologic data, *Mississippi River basins, Water supply, Water utilization, Aquifer characteristics, Water yield, Groundwater recharge, Water quality, Potential water supply, Evaluation.
Identifiers: *Upper Mississippi Region.

The Upper Mississippi Region in general is rich in water--surface water is plentiful, and groundwater is a large, important, and manageable resource. This report emphasizes the role of groundwater in the region. Total potable groundwater in the outwash and alluvial aquifers in the Mississippi River valley and the subbasins is about 45,000 billion gallons. Groundwater in storage in other aquifers of the region is probably several times that in the outwash and alluvial aquifers. Estimated groundwater recharge in the subbasins is 23,000 mgd. Groundwater use by domestic, commercial, and rural interests is only 4 percent of recharge. Groundwater use (1965) by industry is only 3 percent of

recharge. Part of the region has groundwater resources capable of satisfying more than local needs. Specifically, the water in the outwash and alluvial aquifers in much of the valley of the Mississippi River south of St. Paul, Minn., of the Illinois River, the lower Minnesota River, the upper Wisconsin River, the lower Black River, the Wapsipinicon River, the lower Rock River, and the upper Des Moines River can be considered a regional resource. Groundwater in these areas could supply approximately 20 million additional people. (Woodard-USGS)

Descriptors: *Input-output analysis, Hydrology, Environmental control, *Forest management, *Minnesota, Methodology, *Alternative water use, *Water utilization, Economics, Evaluation, Water demand, Alternative planning.
Identifiers: Itasca County(Minn), *Hydronomic analysis, *Environmental quality.

The objective was to develop a methodology that integrates water use and environmental quality parameters into an economic system to evaluate forest management alternatives. The input-output technique was the general methodology used for integrating water use. Direct and direct-plus-indirect water use coefficients (total withdrawn and consumptive) were determined for each of the 34 economic sectors in Itasca County, Minnesota. An example was developed that compared the water yield from the harvesting alternatives of clear-cutting, strip cuts, and selection cuts. A zero water use coefficient was used for timber production, under surplus conditions, and the water required was 44 million gallons. This value was low in relation to the increased water yield. Under assumed water scarcity situations, the water use coefficient was 175,560 gallons/dollar of output for timber production, and the water required became 16.2 billion gallons which was much greater than the increased water yield. BOISE POST-AUDIT STUDY, HYDROLOGY SUPPORT STUDY,
Idaho Univ., Moscow. Dept. of Civil Engineering.
C. C. Warnick, and C. E. Brockway.
Available from the National Technical Information Service, Springfield, Va 22161 as PB-248 148, $6.75 in paper copy, $2.25 in microfiche. Idaho Water Resources Research Institute, Moscow, Completion Report, June 1974. 157 p, 36 fig, 27 tab, 63 ref. OWRT C-4202(9061)(1).

Descriptors: Water management(Applied), Hydrology, *Multipurpose projects, *Idaho, Water resources development, Flood control, Irrigation, *Oregon, *Return flow, *Reservoir operation, *Water utilization.
Identifiers: *Boise project(Idaho-Oregon).

This is the first support study for a Case Study of Federal Expenditures on a Water and Related Land Resource Project: Boise Project, Idaho and Oregon. Although development in the Boise River Basin has been taking place over the past 110 years, the Boise Project is typical of numerous reclamation developments throughout the Western United States. The Boise Project has been the subject of continuous planning and development effort by both the U.S. Corps of Engineers and the U.S. Bureau of Reclamation since 1905. For these reasons the Boise area was chosen as the case study for this research. This sub-project report provides hydrologic information for the Boise River on diversions and return flows, reservoir operation, irrigation systems, water law and floods. The data is presented as a basis for subsequent phases of a multidisciplinary study to assess federal expenditures on a water and land resource project. Information on both surface water and ground water aspects of the Boise Valley is included. (See also W76-02373 and W76-02374)

Descriptors: *Decision making, *Project post-evaluation, *Idaho, *Oregon, Government supports, Expenditures, Water resources development.
Identifiers: *Boise project(Idaho-Oregon).

This is the second support study for A Case Study of a Federal Expenditure on a Water and Related Land Resource Project, Boise Project, Idaho and Oregon. As modern technology, affluence and population growth place more demands on water use, the public is demanding better management and use of our water resource. The purpose of this study is to present an analysis of the role of the federal government in water development in the Boise Project of Idaho and Oregon. As a result of this study and two related support studies, the following conclusions, and recommendations are presented and discussed: -- Ex-post analysis of a selected water resource project can contribute to more responsive planning, decision making and better allocation of resources. -- Ex-post analysis, structured so as to utilize the Principles and Standards, will provide maximum utility to the planner. -- Ex-post analysis should be structured following societal objectives rather than traditional water use functional objectives. The Principles and Standards, with modification, can accommodate this approach. -- The influence of exogeneous forces on beneficial and adverse effects must be considered if a realistic appraisal is to be obtained through an ex-post analysis. Identifiers: Boise Valley(Idaho), Deer Flat Re voir, Arrowrock, Anderson Ranch, Lucky Pe Ada County, Canyon County, *Boise ject(Idaho-Oregon).

This is the third support study for A Case Study Federal Expenditures on a Water and Rela Land Resources Project: Boise Project, Idaho Oregon. Prior to the Boise Project, any extens irrigation in the Boise area was confined to flood plain and Eagle Island. Federal expenditu in area dams and reservoirs provided irrigat water for the entire agricultural area for the len of the growing season. Without these expe tures, irrigation would be far more dependent groundwater sources, and probably would cove smaller area. Many ecological changes and dam in the area were not as a result of the Boise P ject, but of revious mining and logging operati in the upper reaches and irrigation in the lower ley. Post-project pollutants include industrial fluent, urban surface runoff, and topsoil sedim loss. Initial study attempts to differentiate proj and non-project impacts by specific time interv were handicapped by widespread pre-existing rigation, the long time interval between congr sional discussion of authorization and complet of the project, the impact of private entrepeneu the role of the railroad in route and townsite sel tion, and the role of Boise as state capitol, tra portation node, largest city and region and fede trade center. Identifiers: Opportunity cost.

Principles are given for dealing with price and interest rate projections when benefit-cost analysis of water resource projects must be performed using data which reflect expected inflation. Prices and interest rates must be considered simultaneously and consistently, that is, projected in either real or nominal terms. The Water Resources Council's recommendations as modified by the Water Resources Development Act of 1974 did not acknowledge the joint nature of price and interest rate projections, but recommended real prices be projected and real benefits and costs be discounted using a nominal interest rate. However real prices should be projected for undiscounted expected benefits and costs and real interest rates used to discount these values. The interest rate used with real prices should not be the recommended' adjusted nominal financial rate' or real financial rate, but the real opportunity cost rate. Because the prediction of relative prices is difficult, benefits from precision should be compared to costs in implementing benefit-cost procedures; usually this is only feasible for large shifts in relative values. (Buchanan-Davidson--Wisconsin).

BROADER LOAN PROGRAM INTRODUCED FOR MUNICIPAL SEWERAGE PROJECTS.
Water and Pollution Control, Vol 113, No 9, p 18-19, September 1975. 1 fig, 1 tab.

Descriptors: *Legislation, *Loans, *Sewers, *Sewerage, *Treatment facilities, Costs, Grants, Regional analysis, Design criteria, Municipal wastes, Financing.

The federal government of Canada, through the Central Mortgage and Housing Corporation (MCHC) has passed new legislation to provide additional financial assistance to provinces, municipalities, and municipal sewerage corporations. Eligible projects for aid are defined. These include: sewer treatment projects, such as treatment facilities, and trunk collector sanitary sewers; trunk storm sewer systems; and regional sewerage plans. Loans for sewage treatment facilities, trunk collector sanitary sewers, and trunk storm sewer systems may be made in an amont up to two-thirds the eligible cost of the project. Loan forgiveness is also possible, for about one-sixth of the eligible project costs as determined by CMHC, or 25% of the principal and 25% of the acrued interest with respect to loan advances as at the date of project completion. Grants are also made for the establishment or expansion of a sewage treatment project or the construction of a trunk storm sewer system where no loan has been made by CMHC. Grants are also available when the cost of a sewage treatment project imposes an excessive per capita burden on taxpayers. Additionally, CMHC may make a grant to a province or municipality not exceeding one half the cost of the preparation of a Regional Sewerage Plan. Eligivle project costs are defined, including construction costs, land costs, and the related costs of design and supervision, legal services, interim financing during the construction period and other costs as approved by CMHC. THE DEMAND FOR AGRICULTURAL WATER IN UTAH,
Utah Water Research Lab., Logan.
M. H. Anderson, J. C. Andersen, J. E. Keith, and C. G. Clyde.
Available from the National Technical Information Service, Springfield, Va 22161 as AD-A001 077, $4.50 in paper copy, $2.25 in microfiche. Report PRWG100-4, September 1973. (Corps of Engineers Institute for Water Resources Report 74-4, AD786698). 60 p, 6 fig, 8 tab, 43 ref. DACW31-71-C-0063.

Descriptors: *Water demand, *Agriculture, *Utah, *Water resources development, *Economic feasibility, Irrigation, Water importing, Water resources, Optimization, Water utilization, Rotations, Regional analysis, Economic justification, Crop production, Cultivated lands, Model studies, Land development, Linear programming, Alternative planning, Consumptive use.

To provide economic information for decisions concerning development and use of water resources for agriculture in Utah, irrigated and potentially irrigable lands were estimated in all ten of its hydrologic subregions. Water use factors, crop rotation constraints, production costs, yields, product prices, and costs of bringing land into production were computed and used in a linear programming model to determine a normalized demand schedule for water use in agricultural production. Water available to the production model for each subregion was varied thus the model created a marginal value product at each level, these were combined to estimate relationships between water quantity and economic value. Most of Utah suffers from water shortage; production could be increased from irrigated land by using more water and/or water transfer from lands with low productivity to higher quality land. There are many examples of water waste. The model does not adequately evaluate the economic feasibility of water importation, but regions with the greatest development potential are identified. With present cost and price structures, agriculture could probably not economically justify most water importation schemes. Many promising areas for development have large water supplies but municipal and industrial uses are projected to remove agricultural land from production. (Buchanan-Davidson--Wisconsin)

DEEPWATER PORT ACT OF 1974.
Public Law 93-627; 88 stat 2126, 1974. 25 p.

Descriptors: *Harbors, *Deepwater, *Environmental control, Construction, Legislation, Regulation, Control, Environmental effects, Public health, Ocean currents, Penalties(Legal), Ecology, Transportation, Water, Water law, Offshore platforms, Oceans, Oil spills, Ships.
Identifiers: *Deepwater Port Act, *Commerce, Licenses, Hazardous substances(Pollution).

This is an Act to regulate commerce, promote efficiency in transportation, and protect the environment, by establishing procedures for the location, construction, and operation of deepwater ports off the coasts of the United States. The Act provides that no person may engage in the ownership, construction, or operation of a deepwater port without a license. The Secretary of Transportation is authorized to promulgate regulations pertaining to application, issuance, transfer, renewal, suspension, and termination of licenses. The Secretary is also authorized to establish environmental review criteria consistent with the National Environmental Policy Act. Such criteria would include: the effect on the marine environment, oceanographic currents, land-based developments related to deepwater ports, human health and welfare, and other considerations deemed appropriate. Criminal and civil penalties are provided to enforce the Act. Provisions are also included relating to navigational safety, international agreements, recordkeeping and inspection, public access to information, judicial review, adjacent coastal states, antitrust review, and common carrier status. RESOURCE SCARCITY, ECNOMIC GROWTH AND THE ENVIRONMENT.
Hearings--Subcommittee on Priorities and Economy in Governments, Joint Economic Committee, 93rd Congress, 1 st Sess, Dec 19, 20, 21, 1973. 192 p, 30 fig, 2 photo, 14 tab.

Descriptors: *Sewers, *Detergents, *Environmental effects, Chlorine, Soaps, Surface waters, Biodegradation, Water pollution, Wastes, Oil, Alkalis(Bases), Mercury, Phenols, Sewage disposal, Sewage effluents, Sewerage, Water law, Legal aspects, Water.
Identifiers: *Petrochemicals, Congressional Hearings, Residues, Mercury pollution, Hazardous substances(Pollution).

These Congressional Hearings on Resource Scarcity discuss various problems relating to water and other resources. For example, one major petrochemical product-synthetic detergents - produces appreciable deleterious effects on the environment. This occurs because of phosphates which enter surface waters from municipal sewage systems. Many such petrochemical products are not unique, but merely replace older pre-existi products such as soap that were much less harmf to the environment. Even the newer detergent which are regarded as degradable leave a resid of phenol which may not be degraded and may a cumulate in surface waters. The impact of chlori and mercury on surface waters is also brief discusses. (Parrish-Florida)

FLOOD DAMAGE--CREATES ACT TO PREVENT.
Ill Pub Act 78-400, Sec 1-4 (1973), 1 p.

Descriptors: *Illinois, *Rainfall-runoff relationships, *Construction, *Retention, *Permits, Permeability, Municipal water, Rain, Rain water, Snow, Snow management, Snowmelt, Soils, Soil analysis, Soil moisture, Buildings, Building codes, Ponds, Planning, Runoff.

In order to minimize and prevent flood damage, this act authorizes Illinois counties and municipalities to adopt water runoff control requirements as part of the general building permit regulations. A suggested ordinance would require a building permit application be accompanied by a statement that the proposed construction includes facilities for orderly runoff or retention of rain and melting snow. In issuing the permit, factors such as soil permeability and adequacy of existing waterways would be considered. (See also W76-02081) (Parrish-Florida)
W76-02086

STUDY AND SURVEY OF LAKE MICHIGAN SHORELINE.
Ill Rev Stat, Chap 19, Par 1141-1146, (1973).

Descriptors: *Illinois, *Erosion, *Lake Michigan, *Shore protection, *Administrative agencies, Management, Planning, State governments, Federal government, Littoral drift, Littoral, Shores, Waves(Water), Structures, Currents(Water), Construction, Real property, Damages, Costs, Projects.
Identifiers: Great Lakes Naval Training Facility, Illinois Division of Water Resource Management.

This Act authorizes the Division of Water Resource Management to make studies and surveys of the shoreline of Lake Michigan. The main purpose of such studies is to devise means of preventing erosion of the shore by waves, currents, and natural and artificial structures, so as to prevent or minimize damage to homes and danger to human life. In this undertaking, the Division is authorized to cooperate with any agencies of the federal government it deems necessary. Furthermore, it is to work with the federal government in determining what influence the construction of the Great Lakes Naval Training Facility is having upon the southerly movement of littoral material along the west shore of Lake Michigan. (See also W76-02081) (Parrish-Florida)
W76-02087

ILLINOIS MUNICIPAL CODE (PROVISIONS RELATING TO MUNICIPAL JURISDICTION OVERWATERS AND WATERWAYS).
Ill Rev Stat, Chap 24, Par 7-4-4 thru 11-123-23, (1973), 12 p.

Descriptors: *Illinois, *Harbors, *Local governments, *Management, *Jurisdiction, Municipal water, State governments, United States, Administrative agencies, Flooding, Flood control, Canals, Canal construction, Channels, Channel improvement, Structures, Water purification, Boats, Legal aspects, Real property, Projects, Construction.
Identifiers: *Submerged lands.

The water law of Illinois relating to cities, villages and incorporated towns are herein revised and codified. Municipalities are given jurisdiction over all waters to the extent of three miles beyond the corporate limits, and are authorized to take appropriate actions regarding washing away of river banks, purification of waters, use of wharves and anchorage of boats. Corporate authorities may relocate channels, fill in water courses, and condemn property subject to certain restrictions. Any city or village bordering upon public waters has the right to construct and operate a harbor for the use of the public, with all rights of the State of Illinois, in and to submerged lands within and adjoining the harbor area, to be vested in the city or village. This means the harbors under this act are tax exempt. Furthermore, municipalities may: (1) occupy and reclaim submerged lands; (2) alter or construct channels and canals; (3) construct flood protection works; (4) contract with the United States in flood protection works; and (5) establish dock and harbor lines. All these powers are subject to the provisions of other acts, and are thus limited in varying degrees. (See also W76-02081) (Parrish-Florida)
W76-02088

COUNTIES (PROVISIONS OF ILLINOIS STATUTES RELATING TO COUNTY JURISDICTION OVER WATERS AND WATERWAYS).
Ill Rev Stat, Chap 34, Par 2-3, 430, 3101-3116 (1973) 3 p.

Descriptors: *Illinois, *Water supply, *Drainage, *Flood control, *Administrative agencies, Supervisory control(Power), Rivers, Navigation, Reclamation, Legislation, Wildlife, Fish, Waterusers, Water utilization, Planning, Federal government, Streams, Construction, Projects, Local governments, State governments, Water pollution control, Coordination, Water resources.

This Act authorizes those Illinois counties who adopt it to exercise all powers deemed necessary to control and alter waters within county boundaries. This includes reclamation and irrigation of land, filling up of watercourses, construction of dikes, dams, canals and reservoirs, and acquisition of real property by purchase, donation or condemnation. In addition, county boards are to supervise the flow of streams and rivers, and to cooperate as necessary with agencies of the United States in flood control and conservation projects. Pollution control also comes under the control of the county boards, although subject to the supervening authority of the State Pollution Control Board. (See also W76-02081) (Parrish-Florida)

THE ICELANDIC FISHERIES DISPUTE: A DECISION IS FINALLY RENDERED,
R. A. Briney.
Georgia Journal International and Comparative Law, Vol 5, p 248-256, 1975, 9 p, 59 ref.

Descriptors: *International Law, *Law of the Sea, *Jurisdiction, *Commercial fishing, *Boundary disputes, Foreign waters, International waters, Treaties legal aspects, Legal Review, Judicial decisions, Foreign countries, Fish management, Fish harvest, Water rights, Water law political aspects, Common law, Fish conservation, History.
Identifiers: *Iceland, Coastal zones, United Kingdom, Fishery resources, Coastal states.

The Icelandic Fisheries dispute came to a climax in 1971 when Iceland announced its intention to extend its fisheries jurisdiction to 50 miles. Following unsuccessful attempts to resolve the problem the United Kingdom took its case to the International Court of Justice. The United Kingdom sought resolution of the following issues: (1) that the claim by Iceland of entitlement to a zone of exclusive fisheries jurisdiction extending 50 miles is invalid; (2) that Iceland may not uni-

laterally assert such extended jurisdiction against the United Kingdom in violation of previous agreements between the two countries; and (3) that Iceland and the United Kingdom are under a duty to negotiate this problem in good faith. The Court's decision, however, did not answer the important question of whether the jurisdiction extension was legal. Basically the decision merely provides moral persuasion for the parties to continue negotiations. Future negotiations, the Court found, should take into account the following factors: Iceland's preferential rights based on its dependence on the area; the United Kingdom's historic right of access; the interests other states may have in these fisheries; andthe need to conserve the fishery resources involved. MAKING ENVIRONMENTAL LEGISLATION WORK,
Minnesota Mining and Mfg. Co., St. Paul.
J. T. Ling.
Federal Bar Journal, Vol 33, p 119-125, 1974, 7 p.

Descriptors: *Natural resources, Environmental effects, *Conservation, *Federal government, *Technology, Legal aspects, Legislation, Management, National Water Pollution Control Act, Natural resources, Water resources, Water pollution, Water pollution control, Water pollution abatement, Water quality, Water quality control, Energy, Resources development, Economics, Resource allocation, Environmental engineering, Air pollution.
Identifiers: *Environmental policy, FWPCA Amendments of 1972.

The current national policy of environmental protection expressed in legislation such as the federal Water Pollution Control Act is unrealistic in that it calls for the elimination of all pollution. Furthermore, it requires an inordinately large amount of natural and financial resources while ignoring other important environmental considerations. Pollution control should be but one beneficial result of a broader national goal: resource conservation. Resource conservation requires a total environment concept, including wise management of all available resources in the environmental system. Resource conservation also requires replacing the present consumption-oriented value system with a resource-oriented technology that will minimize the use of primary natural resources and maximize re-use of resources which have already been used or discarded. FREEDOM OF SCIENTIFIC RESEARCH: STEPCHILE OF THE OCEANS,
Virginia Univ., Charlottsville. School of Law.
C. Maechling.
Virginia Journal of International Law, Vol 15, p 537-559, 1975, 23 p, 63 ref, 1 append.

Descriptors: *Research and Development, *Oceans, *International waters, *United Nations, *International law, Economics, Straits, Fisheries, Water pollution, Continental shelf, Research facilities, Resources development, Foreign research, Technology, Law of the Sea, Legal aspects, Treaties, Political aspects, Foreign countries, Jurisdiction.
Identifiers: Coastal states, *Law of the Sea Conference, Marine pollution, International disputes.

The Third United Nations Law of the Sea Conference did not reach the issue of freedom of scientific research in the oceans. It is the thesis of this article that the maritime powers have failed to accord protection of scientific research the high priority it deserves. A brief survey on the present status of the major issues at the Conference, the resolution of which directly affects scientific research, is presented to provide background on the Conference. These issues include the extent of territorial seas, control of straits and archipelagoes, determinating economic zones, protection of fisheries, and prevention of marine pollution. As things now stand, scientific research is subject to the arbitrary control of coastal states in their territorial seas, and to regulation by international agreement on or over the continental shelf. It remains unrestricted on the high seas but with the area of coastal state control steadily expanding the crucial question is whether the claim of scientific research to protected status will survive, or whether coastal state assertions of sovereignty will culminate in an agreement giving international sanction to encroachments and subsequent restrictions on the high seas. (Hoffman-Florida)

NO WAIVER OF SOVEREIGN IMMUNITY 'IMPLIED FROM STATES' ENTRANCE INTO A FEDERALLY REGULATED AREA UNLESS THERE EXISTS AN EXPRESS PRIVATE RIGHT OF ACTION AGAINST THE STATE,
A. A. De Sabato.
Villanova Law Rev, Vol 20, p 201-213, 1974-75, 13 p, 79 ref.

Descriptors: *Constitutional law, *Navigable waters, *Bridge failure, *Georgia, *Judicial decisions, Water law, Federal jurisdiction, State jurisdiction, Penalties(Legal), Barges, Damages, Navigation, Channels, Jurisdiction, Ships, Bridges, Costs, Legal aspects.
Identifiers: Sovereign immunity, Tort liability.

A privately owned tugboat and barge, laden with heavy cargo, were unable to pass beneath a drawbridge on the Flint River in Georgia. The bridge could not be raised because it had not been paved over by the state. The owner of the barge brought suit against the state of Georgia alleging that the delay in delivery of the cargo resulting from the negligent operation of the drawbridge had caused it considerable monetary damage. Georgia moved to dismiss the suit on grounds of sovereign immunity under the eleventh amendment of the United States Constitution. The barge owner contended that since the bridge was built on a navigable waterway and was therefore subject to the Bridge Act of 1906, the state had waived the sovereign immunity defense by entering a federally regulated sphere of activity. The district court agreed and denied the motion to dismiss. On appeal, the Fifth Circuit reversed, holding the state entrance into a federally regulated sphere did not constitute a waiver of sovereign immunity unless Congress had provided a private cause of action for violation of the applicable regulatory statue and made it applicable to the states. Rivers System

The purpose of this legislation is to include
Chattooga River in the Wild and Scenic Riv
System and to make various general amendme
to the Wild and Scenic Rivers Act. The Chattoo
River runs through North Carolina and So
Carolina before it empties into Lake Tugaloo
Georgia. Sections of the rivers included in
Wild and Scenic Rivers System are generally cl
sified in three categories--wild, scenic, or recre
tional--depending upon the nature of each sectio
the amount and type of access to it, the charac
of the area surrounding it, and the degree
development along the shoreline. The Chattoo
River will include 40.3 miles classified as wild; 6
miles classified as scenic; and 10.1 miles classifi
as recreational. The Committee on Interior and
sular Affairs recommends the Chattooga be
cluded in the System in order to preserve its ecol
gy and the beauty of the river and its environs. T
Committee notes that few alternative uses of t
area, such as harvest of timber sources a
hydroelectric power production, are economical
feasible. Also presented are general amendmen
to the Act proposed to remedy deficiencies whi
have surfaced during the past five yea

The submerged lands surrounding the Rose Ato
National Wildlife Refuge in American Samoa ar
necessary for the protection of the atoll's marin
life, especially the green sea and hawksbill turtles
The submerged lands in Apra Harbor and thos
adjacent to Inapsan Beach and Urano Point i
Guam, and certain submerged lands on the wes
coast of St. Croix, United States Virgin Islands
are required for national defense purposes. Fo
these reasons Gerald Ford, President of th
United States, proclaimed that these lands are ex
cepted from the transfer to the Government o
American Samoa, the Government of Guam an
the Government of the United States Virgi
Islands under Section 1(a) of Public Law 93-435. A
description of the land involved is presented. The
submerged land in American Samoa will now be
under the joint administrative jurisdiction of the
Department of Commerce and the Department of
the Interior, while all of the excepted land within
the territories of Guam and the Virgin Islands will
be under the administrative jurisdiction of the De-
partment of the Navy. (Hoffman-Florida)

ptors: *Adoption of practices, *State nments, Planning, *Coastal plains, ronmental control, Coasts, Environmental s, Legislation, Administrative agencies, l government, Industrial wastes, Industries, Ecosystems, Resource allocation, Manage- Land use, Water users, Water quality con-

fiers: *Environmental impact statement, tal Zone ManagemenA act.

rth in this document are guidelines proposed e National Oceanic and Atmospheric Ad- ration pursuant to section 306 of the Coastal Management Act for reviewing state pro- . The guidelines provide that statement of issues and policies shall accompany any sed program in order to assure that it is con- t with national policies expressed in the Act. nvironmental impact statement is also ed. If the proposals are adopted the coastal will henceforth include only those land e development will have a direct impact on l waters. Identification of permissible land vater uses which have such an impact on al waters shall include an inventory of natural nan-made coastal resources, an analysis of apabilities of each resource, and a report of ojected impact of each use upon the natural onment. To assist states in assuring that pro- s for siting facilities which serve other than needs also comply with national guidelines, a such facilities is set forth. As for other state ams, procedural and organizational means plementing them must be established before approval is granted, along with evidence that have been formally adopted in accordance state law. Guidelines for public hearings, gu- torial review, and approval and applicability and water pollution control requirements are ded. The final set of guidelines deals with ap- tion procedures for administrative grants to sed in conjunction with the Grants Manage- Manual under the Act. (Jenkins-Florida) 02101

DELINES FOR REVIEW OF FISH AND DLIFE ASPECTS OF PROPOSALS IN OR ECTING NAVIGABLE WATERS.
and Wildlife Service, Washington, D.C.
ral Register, Vol 39, No 159, p 29551-29565, ust 15, 1974, 15 p.

riptors: *Adoption of practices, ninistrative agencies, *Environmental ef- , *Permits, *Wildlife conservation, Fish con- ation, Ecosystems, Inter-agency cooperation, ning, Drainage programs, Navigable waters, ral government, Legislation, Pollution abate- , Ports, Structures, Water manage- (Applied), Navigation.
tifiers: Guidelines(Administrative), vironmental impact statement.

tive guidelines are proposed in handbook by the Director of the Fish and Wildlife Ser- to assist service employees in reviewing osals for federal activities to be conducted in gable waters. The central focus is on the gation permit program of the Corps of En- ers for dredge and fill activities. The handbook vided into six sections, the first of which sum- zes and categorizes federal activities requiring ous agency permits. Section Two presents an rview of the policies of the Service relating to e activities. The procedure for preliminary ening of proposals is prescribed in Section ee, while elements of field studies used in rmining the impact of a proposal on fish and life are set forth in Section Four. Specific pol- icy guidelines for review of proposals for categories of docks and piers, marinas and port facilities, cables, jetties, lagoons, and other structures appear in section five. The last section provides guidelines for coordination with other agencies. Procedures for service reports and environmental impact statements conclude the handbook. (Jenkins-Florida)

WATER RIGHTS LAWS IN THE NINETEEN WESTERN STATES, VOL I,
W. A. Hutchins.
U.S. Dept of Agriculture, Miscellaneous Pub No 1206, Vol 1, 1971, 650 p. Completed by H. H. Ellis and J. P. DeBraal.

Descriptors: *Diversion, *Usufractuary right, *Appropriation, *Beneficial use, *Prescriptive rights, Riparian rights, History, Arid lands, Preferences(Water rights), Navigable waters, Legal aspects, Judicial decisions, Priorities, Water utilization, State governments, Federal government, Irrigation, Permits, Administrative agencies, Water users, Water allocation(Policy), Pacific Coast Region, Real property, Water.
Identifiers: *Western States.

The arid conditions prevailing in most of the Western states have led to modification and, in some cases, repudiation of the riparian water rights doctrine of the humid East. In its place, an alternative body of water law has arisen based upon appropriation of water for beneficial use. This book is a comparative analysis of the development and status of the constitutional provisions, statutes, court decisions, and administrative policies regarding water law rights in the nineteen western states, including Alaska and Hawaii. The analysis includes the nature of such rights, their acquisition, control, exercise, transfer, protection and loss. Historical origins, interstate conflicts, and Federal influences are also examined. Volume One concentrates on (1) types and characteristics of watercourses, (2) the property nature of water and water rights, (3) water rights systems, and (4) the nature, acquisition and exercise of the appropriative right. (Parrish-Florida)

CENTRAL COLORADO WATER CONSERVANCY DISTRICT V. COLORADO RIVER WATER CONSERVATION DISTRICT (CANCELLATION OF CONDITIONAL DECREE WHEN DISTRICT REFUSED TO COMPLY WITH FACILITY CONSTRUCTION STATUTE).
526 P2d 302-04 (Colorado 1974), 3 p.

Descriptors: *Colorado River Basin, *Appropriation, *Water allocation(Policy), *Constitutional law, Preferences(Water rights), Water law, Judicial decisions, Legal review, State jurisdiction, Colorado, Colorado River, Legislation, Legal aspects, Public rights, Water conservation, Water policy, Water supply, Water management(Applied), Rationing(Water), River basin development.
Identifiers: *Statutory requirements.

Plaintiff, a statutorily created water conservancy district, had filed an application for the right to appropriate water from the Colorado river basin. Despite opposition from several governmental units, the trial court conditionally approved the application, provided that the plaintiff satisfied prescribed statutory requirements. Those requirements, which were part of the statutory scheme authorizing creation of the plaintiff, provided that facilities needed to transport the appropriated water could be constructed and operated only if no damage was caused to water users within the basin. Plaintiff, contending the requirements were unconstitutional, appealed. The Colorado Supreme Court, sitting en banc, affirmed the decision, holding that a governmental entity created by a statute cannot attack that same statute. Furthermore, the right to appropriate state waters belongs to the people. Thus, the legislature may condition the granting of appropriation rights upon the satisfaction of prescribed requirements. (Hoffman-Florida)

WATCHORN BASIN ASSOCIATION V. OKLAHOMA GAS AND ELECTRIC COMPANY (ELECTRIC COMPANY'S ACQUISTION OF LAND NOT A PRE-REQUISITE FOR WATER APPLICATION TO WATER RESOURCES BOARD).
525 P2d 1357-59 (Oklahoma, 1974), 3 p.

Descriptors: *Oklahoma, *Appropriation, *Condemnation, *Electric power plants, *Diversion, Administrative decisions, Judicial decisions, Legal review, Administration, Water law, Land use, Land development, Utilities, Legal aspects, Streams, Eminent domain, Water permits.

Respondent utility company filed an application with the Water Resources Board seeking authority to appropriate creek water, which would be used by its new generating station. The company had already acquired part of the land necessary for this project and was attempting to acquire the remaining land needed, including petitioners' land. To prevent construction of the generating station, petitioners sought a writ of prohibition from the Oklahoma Supreme Court to prohibit the Board from considering the utility company's application. Petitioners contended that the company did not have the authority to condemn their land, and that the Board could not consider the application until all of the land needed for the project was acquired. The Supreme Court rejected this argument, however, denying the writ and holding that the acquisition of all necessary land was not a prerequisite to Board consideration of the application. The Court did not decide the issue of whether respondents could condemn the petitioners' land. (Hoffman-Florida)
W76-02107

TALBOT V. GRAY (LAKESIDE DOCK A PERMITTED ACCESSORY USE WITHIN ZONING ORDINANCE).
525 P2d 801-804 (Wash Ct App, 1974), 4 p, 1 map.

Descriptors: *Washington, *Adjacent landowners, *Zoning, *Docks, *Construction, Permits, Shores, Legal aspects, Regulation, Land use, Lakes, Legislation, Penalties(Legal), Judicial decisions, Legal review, Land use.
Identifiers: *Notice requirements.

Plaintiff landowners had brought suit to enjoin defendant adjoining landowners from constructing a dock on the shoreland of a lake. Plaintiffs contended that the permit issued to defendants by the city was invalid since the local zoning ordinance prohibited the construction. The trial court rejected this contention, however, denying injunctive relief, and awarding damages to the defendants for legal expenses incurred defending the action. On appeal, plaintiffs once again contended

LIBRARY U. OF I. URBANA-CHAMPAIGN

that the zoning ordinance had been improperly interpreted. They also reiterated their contention that defendants had not given adequate notice of the construction as required by the state Shoreline Management Act of 1971, which has been implemented by a local ordinance. In affirming the court held that since defendant's notice satisfied the requirements of the Act, it was irrelevant that it did not satisfy the ordinance requirements (Hoffman-Florida)
W76-02108

DAYLEY V. CITY OF BURLEY (NOT PERMISSIBLE TO DIVERT CITY STORM WATERS INTO CREEK WHICH WAS NOT A NATURAL WATER COURSE).
524 P2d 1073-77 (Idaho 1974), 5 p.

Descriptors: *Idaho, *Riparian rights, *Watercourses(Legals aspects), *Surface waters, *Streams, Cities, City planning, Drainage systems, Drainage effects, Sewers, Stormwater, Right-of-Way, Public rights, Legal aspects, Diversion, Runoff, Judicial decisions.
Identifiers: Injunctive relief, Nuisance, Sovereign immunity.

Plaintiff landowner brough an action to enjoin defendant city from diverting water from city's storm system into a creek which transversed plaintiff's property. The city contended it was merely channelling surface water into the storm system. It also contended that it was an upper landowner with a servitude over lower lands to discharge water into natural water courses. In affirming the lower court's decision to enjoin the city from diverting storm waters into the creek, the Supreme Court of Idaho noted that the water course in question was actually a creek bed that had not carried water since the upper creek has been dammed, in 1921, and that portions of the creek bed had been altered or eliminated. Thus, while recognizing that a natural servitude of drainage may exist between enjoining lands, the court held the city has no prescriptive right to discharge water into what is no longer a natural water course. (Gray-Florida)
W76-02109

FULLENWIDER V. BAGWELL (WIDE COURT DISCRETION IN SHAPING INJUNCTIVE RELIEF FOR PLAINTIFF'S UNCONTESTED WATER RIGHT).
524 P2d 619-22 (Colorado Court of Appeals, 1974), 4 p.

Descriptors: *Colorado, *Legal review, *Beavers, *Dams, *Riparian rights, Riparian water loss, State governments, State jurisdiction, Trapping, Administrative agencies, Adjacent landowners, Court decisions, Judicial decisions, Watercourses(Legal aspects), Streams, Streamflow, Irrigation, Irrigation water.
Identifiers: *Injunctive relief, *Standing(Legal).

Plaintiff landowners brought action to amend a judgement entered in their favor in an earlier suit where they had sought permission to enter defendant's land for the purpose of removing beaver dams obstructing streams from which plaintiff derived irrigation water. The original judgement denied plaintiff acess to the land, ordering instead the state game and fish commission to trap and relocate the beavers. Plaintiffs contended the efforts of the game commission were unsuccessful and insufficient, and requested additional methods to remove the nuisance. Affirming the lower court's refusal to amend the original order, the Colorado Court of Appeals noted that the evidence before the court clearly supported the feasibility of removing the beavers by live trapping. The court also held that, although the plaintiff had an uncontested water right, the court can exercise wide discretion in shaping injunctive relief, including invoking the services of a state agency not a party to the original action. (Gray-Florida)
W76-02110

AVONDALE IRRIGATION DISTRICT V. NORTH IDAHO PROPERTIES, INCORPORATED (REQUIREMENT OF UNITED STATES TO QUANTIFY WATER RIGHTS FOR STATE COURT ADJUDICATION UNDER MCCARRAN AMENDMENT).
523 P2d 818-22 (Idaho 1974), 5 p.

Descriptors: *Idaho, *Reservation doctrine, *State jurisdiction, *Federal-state water rights conflicts, *Water requirements, Water rights, National parks, Legal aspects, Water law, Projections, State governments, Use rates, United States, Rates, Federal jurisdiction.
Identifiers: *Notice, *Sovereign immunity, Congressional hearings, Water rights(Non-riparian).

Plaintiffs, three Idaho irrigation districts, brought action to adjudicate water rights to Hayden Lake and its tributaries. The United States intervened, claiming water rights based upon the reservation doctrine. Subsequently, the Idaho State Department of Water Administration intervened to deny the United States' claim. The district court held that the United States must quantify its reserved water rights. The Supreme Court of Idaho affirmed, noting that, although the existence of federal reserved water rights is well established, there is inconclusive case law as to whether such rights must be quantified. The court first said that the question of reserved rights is within the purview of 43 U.S.C. S666, generally known as the McCarren Amendment. Furthermore, the court held that the statute's intent is to instill certainty into any adjudication of water rights. In order to assure such certainty, the United States in this case is bound by state law, and reserved water rights must be quantified prior to the time of final adjudication. (Gray-Florida)
W76-02111

FARMERS INVESTMENT COMPANY V. PIMA MINING COMPANY (SALE OF WATER FROM CRITICAL GROUNDWATER AREA IMPROPER UNLESS AT AUCTION TO HIGHEST BIDDER).
523 P2d 487-90 (Arizona 1974), 4 p.

Descriptors: *Arizona, *Groundwater, *Leases, *Adjacent landowners, Legal aspects, Legal review, Natural resources, Land, Administration, Contracts, Judicial decisions, Water policy, Water law, Water allocation, Water conservation, Equitable apportionment, Water consumption(Except consumptive use).

Respondent mining company acquired a 10-year lease within a critical groundwater area from the State Land Department of Arizona. Under the terms of the lease, the respondent could remove as much water as it needed for a $10 yearly charge. Petitioner farming company, owner of many acres within the same groundwater area, brought this action to have respondent's lease declared void. Petitioner contended that the water was a product of the land and thus, under applicable state law, had to be sold at a public auction to the highest bidder. The trial court rejected this contention, however, and granted respondent's motion for summary judgement, holding that the lease in question was of a commercial nature and thus exempt from the statute. On appeal, the Arizona Supreme Court reversed, holding that the lease was null and void. The Court found that the character of a contract is determined by its provisions rather than its label. In this case, even though the lessee was commercial, the Court found that the lease was in reality a sale of water from the state to respondent. Consequently, for such a lease to be valid, it would have to be acquired by the highest bidder at a public auction. (Hoffman-Florida)
W76-02112

MORALES V. WESTERGARD (CALIFORNIA NEVADA INTERSTATE COMPACT AND LAKE TAHOE CONDOMINIUMS)
522 P2d 1224-25 (Nevada, 1974), 1 p.

Descriptors: *Nevada, *Water supply, *Sewage treatment, *Administrative decisions, Administrative agencies, Basins, Water supply development, Water conservation, Administrative decisions, Water management(Applied), Water resources, Water table, Judicial decisions, Legal review, Legal aspects, Gravitational water.
Identifiers: Closed sewer systems.

Petitioner developers attempted to get their condominium map, which described their development's sewage and water supply systems, approved by the Bureau of Environmental Health. The Bureau refused to give its approval, however, finding that the development's use of water from the Lake Tahoe basin would violate the California-Nevada Interstate Compact. As a result of the decision, petitioner sought a writ of mandamus from the Supreme Court of Nevada to compel the Bureau to approve the condominium map. The Court granted the relief sought, finding that the development's proposed use of water would not violate the Interstate Compact. The Court noted that water taken by the development from the Lake Tahoe basin would be returned, except for a minimal amount which would be used for lawn care, to the basin by natural gravity through the closed sewer system. Therefore, the Compact's aim of controlling and conserving water use within the basin would not be violated by the approval of the condominium map. (Hoffman-Florida)

CITY OF ROSWELL V. REYNOLDS (CITY'S CHANGING POINTS OF APPROPRIATION FROM UNDERGROUND WATER BASIN NOT AN IMPAIRMENT OF OTHER USERS' RIGHTS).
522 P2d 796-802 (N.M. 1974), 7 p, 2 tab.

Descriptors: *New Mexico, *Prior appropriation, *Municipal water, *Administrative decisions, *Preferences(Water rights), Regulation, Administration, Judicial decisions, Legal review, Legal aspects, Competing uses, Saline water, Equitable apportionment, Water law, Water allocation(Policy), Water utilization, Basins, Rationing(Water), Water demand.
Identifiers: Appropriation points.

Appellant city sought authorization from the State Engineer to change appropriation points of a specified amount of water from an underground water basin. The State Engineer granted the request, provided that the city would reduce the quantity and rate of pumpage from the new appropriation points. This reduction was deemed necessary, to protect the rights of existing users and to keep the salinity level of waters under the new appropriation points at an acceptable level. After district court affirmance of this decision, the city appealed to the Supreme Court of New Mexico. The Court, after a detailed review of the facts, found that the State Engineer's decision requiring usage reduction was supported by substantial evidence. Consequently, the burden was upon the city to prove that the impairments foreseen by the Engineer would not occur. When the city failed to meet his burden, the Court affirmed the Engineer's decision. (Hoffman-Florida)
W76-02114

WHEATLAND IRRIGATION DISTRICT V. TWO BAR-MULESHOE WATER COMPANY (DETERMINATION OF IRRIGATION DITCH CAPACITY TO COMPLY WITH SEASONAL LEASE).
521 P2d 1334-38 (Wyoming 1974), 5 p.

Descriptors: *Wyoming, *Irrigation ditches, *Water rights, *Flow rates, *Water contracts,

r conveyance, Contracts, Water, Water law, l aspects, Irrigation, Irrigation districts, ies, Water transfer, Irrigation engineering, , Flow measurement, Flow characteristics.
ifiers: Specific performance, Irrigation n.

tiff water company successfully brought suit st defendant irrigation district for specific rmance of an agreement to furnish irrigation r. Plaintiff's predecessor had entered into a in which it granted defendant's predecessor ight to use certain lands as a reservoir site, in n for the right to use such quantity of water as l be carried through two specific irrigation es during the irrigation season of each and y year. In modifying the trial court's findings ct as to the carrying capacity of the ditches in tion, the Supreme Court of Wyoming applied ule that a ditch will carry only that quantity of r than will pass the point of least capacity. the flow rate for the point of least capacity, r than an average rate, should be applied in rmining the quantity of water the parties in- ed to be furnished under the agreement. The t held further that the term 'irrigation season' nt that period of time in each growing season ng which water was needed for the types of s grown by plaintiff lessor, whether or not irrigation season coincided with that of de- ant lessee. (Schilling-Florida)

NINGS V. WALSH (NO SEWER SERVICE ARGE TO HOMEOWNERS WITH SEPTIC NKS EVEN THOUGH SEPTIC TANK'S CON- NTS PLACED EVENTUALLY IN SEWER OF NICIPALITY).
P2d 311-14 (Kansas 1974), 4 p.

criptors: *Kansas, *Sewerage, *Rates, *Septic ks, *Public utilities, Local governments, State ernments, Water, Water law, Legal aspects, er pollution, Sewage disposal, Wastes, Waste osal, Sewage, Sewage disposal, Taxes, Costs.
ntifiers: *Kansas Water Pollution Act, Injunc- relief.

ntiffs, owners and occupiers of homes which e not connected to the municipal sewage tem, brought suit against defendant municipali- seeking declaratory and injunctive relief with ject to the levying of a sewer service charge by municipality. The charge in question was as- sed under a city ordinance providing that per- s using private septic or disposal tanks in the were subject to such a charge. Defendant ar- d that the ordinance was proper under the Kan- Water Pollution Act and other statutory hority. The Supreme Court of Kansas dis- eed, noting that the Act provided for charges ed on the strength and volume of sewage con- uted. and that plaintiffs in fact contributed no vage to the city system. Morever, the other tutes cited by defendant followed the general that sewage charges be keyed to use of the tem. Such fees are considered for services dered rather than a tax. Thus the court held t, under the circumstances, the levying of a vage charge was not authorized by any of the tutes in question, and affirmed a judgement for intiffs. (Schilling-Florida)
6-02116

UEGMAN V. JOHNSON RANCHES, INC. BANDONMENT OF WATER RIGHTS AND E CAREY ACT).
P2d 489-91 (Wyoming 1974), 3 p.

scriptors: *Wyoming, *Water rights, ontracts, *Administrative agencies, ppropriation, Water, Water law, Legal aspects, nstitutional law, Irrigation, Irrigated land, Ir- ation water, Permits, Water utilization.
ntifiers: *Carey Act, Abandonment.

Appellee landowner filed petitions for declarations of abandonment of certain water rights of appellant landowners based on grounds of non-use. The State Board of Control granted the petitions, and the district court affirmed. Appellants' predecessors had acquired the lands to which the water rights in question applied through operation of the Carey Act. Appellants' predecessors had entered into a contract with appellee's predecessors, under which they were to acquire the means to irrigate their lands. Permits to appropriate water has been issued by the state. Appellants' sole argument on appeal was that the Board of Control had no power to determine the abandonment issue since the water rights in question arose through a contract. The Supreme Court of Wyoming disagreed, holding that although appellants' land had been acquired under the Carey Act, the water rights in question had been obtained in the usual fashion and thus were no different than other water rights. Under the Wyoming Constitution, the waters in question were the property of the State, and were, therefore, subject to appropriation and abandonment. (Schilling-Florida)
W76-02117

CHEROKEE WATER DISTRICT V. COLORADO SPRINGS (SUPPLYING WATER (TO A CITY) OUTSIDE THE WATER DISTRICT).
519 P2d 339-41 (Colo 1974), 3 p.

Descriptors: *Water supply development, *Municipal water, *Colorado, *Water districts, *Supply contracts, Legal review, Judicial decisions, Water allocation(Policy), Water rights, Economics, Water utilization, Water users, Proprietary power, Rates, Municipal water, Water supply.
Identifiers: *Governmental capacity.

Plaintiff water district contracted with defendant city, which was located outside of the district, to provide water for a 10 year period at a fixed rate. The contract also gave the city an option in pertetuity to receive a specified amount of water yearly after the original contract expired. Six years later the water district, which wanted to raise the city's rate, sought a declaration that portions of the contract were void. The water district contended that a new statute giving districts the power to increase water charges authorized it to raise its rates regardless of the contract. It also contended that the option in perpetuity was void as against public policy. The trial court rejected both contentions, finding that the entire contract was valid and enforceable. On appeal, the Colorado Supreme Court affirmed, finding that the statute gave water districts the right to increase to customers within its district. As to customers outside of the district, however, the statute was found to be inapplicable, because the water district was acting in a proprietary rather than a governmental capacity. Thus, the contract with the city was valid. Furthermore, the Court held options in perpetuity in was use contracts not to be against public policy. (Hoffman-Florida)
W76-02118

LEMMON V. HARDY (VALID TO INITIATE WATER RIGHT ON UNSURVEYED PUBLIC DOMAIN BUT NOT ON PRIVATE PROPERTY).
519 P2d 1168-71 (Idaho 1974), 4 p.

Descriptors: *Idaho, *Water rights, *Application methods, *Trespass, *Water policy, Water, Water law, Legal aspects, State governments, Administrative agencies, Relative rights, Permits, Water permits, Water allocation(Policy), Adjudication procedure, Fisheries, Public lands, Real property.
Identifiers: Speculative interests.

Appellants, filers of first application for a water permit, appealed a district court judgement affirming an administrative decision that filers of second application had priority. At the time of their original application, appellants had no interest in any part of the lands on which they proposed to use the waters in question. Subsequent to appellants' application, appellers were declared the successful bidders on the same property which appellants had claimed as a leasehold in their application. Appellants later filed an amended application which changed the place of use of the water. The Supreme Court of Idaho applied the rule that, while a water right initiated on the unsurveyed public domain is valid, a water right initiated by trespass on private property is invalid. Since appellants could develop no valid water rights in private property in which they had no possessory interest, the court held that the filing of their initial application constituted speculation in and of itself and that appellants could not file an application for a water right and then seek a place on which to exercise it. The court, therefore, affirmed the previous decision granting priority to appellees. (Schilling-Florida)
W76-02119

THOMPSON V. HARVEY (NO RIGHT BY OWNERS OF FOURTH PRIORITY WATER RIGHT TO DIVERT CREEK IF DAMAGE TO OTHERS).
519 P2d 963-66 (Montana 1974), 4 p.

Descriptors: *Montana, *Riparian rights, *Water transfer, *Riparian waters, *Appropriation, State governments, Water, Water law, Legal aspects, Water rights, Canals, Diversion, Water policy, Alteration of flow, Water use, Relative rights, Judicial decisions.

Petitioner water rights owners appealed a district court judgement denying a petition for an order authorizing a change in point of diversion on Deep Creek, from a point below the intersection of a canal to a point above such intersection. The petition was protested by owners of water rights subordinate to the petitioners', most of whom were also purchasers of water from the canal. Under Montana law, petitioners were precluded from making the change sought if injury to others was shown to be the result of such change. Petitioners did not deny that the protesters would be injured as a result of the desired change, but contended that the protesters did not have status to object to the change because of their 'unclean hands' and misuse of the creek channel. This argument was based on protesters' practice of removing creek water at points above the canal intersection and replacing such water with canal water. However, the Supreme Court of Montana found the protesters' practice as affirmatively sanctioned by Montana statute. The court, therefore, held that their acts did not bar them from objecting to the proposed change, and affirmed the judgement of the lower court. (Schilling-Florida)
W76-02120

G AND A CONTRACTORS, INC. V. ALASKA GREENHOUSES, INC. (SILTATION OF CREEK CONTINUING TRESPASS REQUIRING RESTORATION MEASURE OF DAMAGES).
517 P2d 1379-88 (Alaska, 1974). 10 p, 1 append.

Descriptors: *Alaska, *Adjacent landowners, *Damages, *Sediment load, *Reasonable use, Sediment control, Judicial decisions, Legal review, Competing uses, Legal aspects, Obstruction of flow, Natural flow doctrine, Relative rights, Construction equipment, Streamflow, Diversion, Alteration of flow, Penalties(Legal).
Identifiers: *Rerouted streams, Ground cover.

Plaintiff greenhouse operator had purchased a large tract of land traversed by a creek. Plaintiff had hoped to use this creek as the focus of a garden showplace and recreation area. When extensive damage was caused to the ground cover and trees along the creek by earthmoving equipment hired by defendant adjoining landowner to reroute the creek on defendant's land, plaintiff

brought suit seeking damages and an injunction to prevent future siltation of the creek. After the trial court had granted the relief sought, defendants appealed, contending that reasonable use of the land included siltation, and that even if damages were proper, the measure of such damages should be the reduction in land value rather than the cost of restoration. In affirming the lower court's judgement, the Alaska Supreme Court held that defendant's use of the land was unreasonable. Furthermore, the Court held that the cost of restoration was the proper measure of damages. (Hoffman-Florida)
W76-02121

SHRULL V. RAPASARDI (RIGHTS OF OWNER AS TO DITCH EXCAVATED OVER ANOTHER'S PRIVATE LANDS).
517 P2d 860-62 (Colo Ct App 1973), 2 p.

Descriptors: *Easements, *Colorado, *Adjacent landowners, *Trespass, *Ditches, Damages, Excavation, Legal review, Judicial decisions, Legal aspects, Law enforcement, Surface runoff, Real property, Water courses(Legal aspects), Drainage systems, Land use.
Identifiers: *Servient land, *Dominant land.

Defendant ranch owners had entered plaintiff's adjoining ranch to open a ditch. Drainage water from plaintiff's property which was intercepted by this ditch was used to irrigate the defendant's land. Seven years after this initial excavation, defendants entered plaintiff's property to reopen the ditch which had become clogged. Following this incident, plaintiff brought suit seeking damages for trespass. At trial, defendants contended that they had acquired an easement across plaintiff's land since the initial excavation of the ditch had been done with plaintiff's knowledge. The trial court agreed and dismissed the complaint. On appeal, plaintiff reiterated his contention that no easement had been granted, and that even if one had been granted, it did not authorize defendants to enter plaintiff's land to reopen the ditch. The court affirmed, however, finding that once the easement for the ditch had been granted, the owner of the servient land could not later deny defendants the right to maintain the ditch. (Hoffman-Florida)
W76-02122

JEWELL V. KROO (REPLACEMENT OF DAM RIGHT OF OWNERS OF WATER EASEMENT WHERE LARGER RESERVOIR REQUIRED).
517 P2d 657-60 (Oregon 1973), 3 p.

Descriptors: *Oregon, *Easements, *Dams, *Damages, *Adjacent landowners, Water requirements, Water rates, Water shortages, Dam design, Dam construction, Damsites, Springs, Spring waters, Natural flow, Legal aspects, Legal review, Judicial decisions, Water users.
Identifiers: *Injunctive relief, Nuisance.

Plaintiff landowners, upon whose property a spring was located, brought action for damages to a rock and earthen dam located on their property. Plaintiffs contended defendants, adjacent landowners, had come onto their property and destroyed the dam. Defendants sought to enjoin plaintiffs from interfering with construction of a concrete dam designed to replace the previous structure. Defendants contended that ownership of an easement for 500 gallons of water per day, coupled with the inability of the original dam to impound a sufficient quantity of water, authorized self-help measures. In affirming the lower court's denial of plaintiffs' request for damages, the Supreme Court of Oregon noted that the owner of a dominant estate may enter a servient estate for the purpose of doing anything reasonably planned to protect his easement. The court noted that where lawful demands for water require the alteration of a reservoir, and the changes made are necessary to meet such demands, self-help is a proper course of action. (Gray-Florida)
W76-02123

GALLUP GAMERCO COAL COMPANY V. IRWIN (APPLICATION OF DOCTRINES RELATING TO OIL AND GAS LEASES TO THE LEASE OF WATER WELL).
515 P2d 1277-81 (New Mexico 1973), 5 p.

Descriptors: *New Mexico, *Wells, *Well casings, *Leases, *Contracts, Maintenance costs, Equipment, Replacement costs, Corrosion, Pipes, Water wells, Well data, Oil wells, Gas wells, Oil industry, Judicial decisions, Contract administration, Municipal water, Water demand.
Identifiers: *Proximate cause, *Injunctive relief.

Plaintiff, lessor of a water well, brought action to recover damages for lessee's failure to supply lessor with an adequate amount of water. Plaintiff also contended lessee had failed to maintain and repair the well as agreed. Defendant city contended its obligations to repair the well did not arise until the expiration of the lease period, thereby precluding plaintiff from having a cause of action prior to the expiration of the lease period. In affirming the lower court's decision to grant plaintiff damages for lessee's failure to supply adequate water to lessor, the Supreme Court of New Mexico moted that the terms of the lease were similar to terms of oil and gas leases, and are therefore to be interpreted by using oil and gas doctrines. In reversing that part of the lower court's decision denying damages for lessee's failure to maintain the well, the court noted that failure to begin well maintenance when well production falls off gives rise to a current cause of action for the lessor. (Gray-Florida)
W76-02124

STATE V. BURTON (NO DAMAGES INVERSE EMINENT DOMAIN OR HIGHWAY CONSTRUCTION NOT CAUSE OF AN ALTERED DRAINAGE PATTERN).
514 P2d 244-50 (Arizona Court of Appeals 1973), 7 p.

Descriptors: *Arizona, *Construction, *Drainage, *Excess water(Soils), *Road construction, Damages, Sediment discharge, Land drainage, Surface drainage, Highway effects, Maximum probable flood, Alteration of flow, Peak flow, Water flow, Land appraisals, Construction, Silting, Runoff.
Identifiers: *Absolute liability, Jury instructions, Proximate causation.

Plaintiff property owner brought action to recover for damages caused by alteration of the local drainage pattern allegedly induced by defendant state's construction of an expressway on adjacent property. Plaintiff contended that an expressway drainage pipe dumped silt and water upon his property, with resulting decrease in value. Defendant agrued that plaintiff's property suffered from poor drainage prior to construction of the expressway, and that the drainage pipe in question had been plugged prior to the trial and thus could not have damaged plaintiff's property. Reversing the trial court's grant of a new trial the Court of Appeals of Arizona found the evidence sufficient to support the jury's finding that the highway construction had not caused an altered drainage pattern. ORCHARD MESA IRRIGATION DISTRICT V. CITY AND COUNTY OF DENVER (CHALLENGE TO DISTRICTS USE OF DUE DILIGENCE IN EXERCISING CONDITIONAL WATER RIGHTS).
511 P2d 25-28 (Colorado 1973), 4 p.

Descriptors: *Colorado, *Water contracts, *Regulated flow, *Use rates, *Regulation, Irrigated land, Irrigation, Relative rights, Water allocation(Policy), Permits, Judicial decisions, L review, Water permits, River regulation, Cont administration, Claims(Contracts)
Identifiers: *Administrative regulations, Bu of proof, Contingent claims.

Appellant irrigation district brought an ac requesting biennial determination of reason diligence regarding a conditional water ri decree. Appellant held one absolute direct decree from the Colorado River in addition to decree in question. Appellers, another water trict, along with the City and County of Den opposed the finding of diligence and claime right to divert water upstream. In affirming lower court's finding of a lack of reasona diligence and cancellation of the conditio decree, the Supreme Court of Colorado noted a showing of intent to use the water together w concrete actions toward finalizing the intended propriation is necessary to meet the burden proving due diligence with respect to conditio water decrees. The court also sustained a find that no action had been taken for fifty years apply the conditional decree to irrigation of lan supporting cancellation of the conditional dec (Gray-Florida)

COUNTY SEDIMENT CONTROL PROGRA (194 AMENDMENTS).
South Carolina Ann, sec 63-195.101 thru 195.106, (Cumm Supp 1974), 3 p.

Descriptors: *South Carolina, *Sediment cont *Water districts, *Erosion control, *Perm Grading, Soil conservation, Civil engineeri Management, Penalties(Legal), Mining, Gover mental interrelations, Repairing, Planning, Silti Construction.
Identifiers: *Siltation control.

This South Carolina statute authorizes counties establish sediments control programs. No grou shall be broken for construction of any kind und this statute, until a county grading permit is issu to the person responsible for such constructio No permit shall be issued until the applicant h submitted a plan to control erosion and siltati and such plan has been approved by the local s and water conservation district board. Each pl submitted is required to include a certification by registered professional engineer or a profession soil conservationist that the plan is designed carry silt to the maximum extent feasible. T statute allows exemptions from obtaining the gra ing permit for different segments, including: (commercial mining operations; (2) agricultur land management and cultural practices; (3) co struction of on farm buildings and structures use in a farming operation; (4) construction of sing family residences or their accessory building which are not a part of their residential subdiv sion; and (5) emergency repairs or maintenance existing structures and facilities which requi ground to be broken. Civil and criminal penalties are provided to enforce the provisions of th statute. (Hoffman-Florida)

, Navigable rivers, Boundaries(Property),
, Streams, Expenditures, Remedies, Boun-
isputes.
fiers: *Submerged land, Water's edge.

iff Department of Natural Resources
ht this action to enjoin defendant lan-
ers from fillings a parcel of submerged land.
dant asserted that the land in question was
anted in a land patent by President Benjamin
son. Plaintiff contended that the land be-
l to the people of Michigan because it was
erged below navigable water, was on the
side of the high-water mark, and was not
d in the patent. Plaintiff also contended that
the land was transferred by the Federal
nment by a patent prior to Michigan's admis-
o the Union, the land belonged to the people.
court decided the case, however, by holding
he land in question was not covered by the
ranted by the patent from the United States.
Michigan obtained title to the land when it
dmitted to statehood. The court also found
he state was not estopped from claiming title
land, and that the Marketable Record Title
loes not apply against the state. (Segall-

opriation, *Groundwater basins, *Recharge,
ona, Application methods, Permits, Wildlife,
ation, Downstream, Construction, Tributa-
Pumping, Agriculture, Water table, Safety,
permits, Prior appropriation, Priorities,
voirs, Judicial decisions.
fiers: Underground waters.

lant Game and Fish Department applied for
nit to appropriate water to construct a reser-
nd store water for wildlife and recreational purposes. The water to be appropriated was the principle source of recharge of a groundwater basin in a critical groundwater area. The permit was denied. On appeal appellant contended that appellee State Land Department lacked authority to reject the application since the only protests to the appropriation had come from downstream users of underground waters; furthermore, appellee had abused its discretion in disallowing the application to appropriate waters. The Court of Appeals of Arizona holding that, even though downstream users had no vested rights in the water sought to be appropriated from the groundwater basin, appellee was not precluded from exercising its discretion, especially since the requested appropriation amounted to 1.7% of the total annual recharge of the groundwater basin in a critical groundwater area. PUTNAM V. CARROLL (SHORELINE MANAGEMENT ACT).
534 P2d 132-35 (Court of Appeals of Washington, 1975), 4 p.

Descriptors: *Environmental effects, *Shores, *Washington, *Permits, *Construction, Legislation, Grading, Retaining walls, Recreation facilities, Buildings, Environment, Rocks, Application methods, Governments, Shore protection.
Identifiers: *Shoreline Management Act, Shorelines, Mandamus.

Appellant property owner sought a writ of mandamus to compel the director of a county building department to issue permits necessary for construction of a planned development on property which was included on a plat filed in 1912. Appellant claimed an exemption under the Shoreline Management Act which provides that, under specified circumstances, no permit will be required for any development on shorelines included within preliminary plat approved by an authorized state agency. The Court of Appeals of Washington held that the plat exemption was not limited to developments described by the plat; however, before a writ of mandamus could issue, there would have to be a factual finding of whether the contemplated development was consistent with the policy of the Act. In reversing and remanding, the court held that if the contemplated development was consistent with all pertinent laws and ordinances, the permit would have to be issued. (Segall-Florida)

CONSTRAINTS ON WATER DEVELOPMENT BY THE APPROPRIATION DOCTRINE.
W. L. Lorah.
In: Vol 4: Hydrology and Water Resources in Arizona and the Southwest, Proceedings of the 1974 Meetings of the Arizona Section, American Water Resources Association and the Hydrology Section, Arizona Academy of Science, April 19-20, 1974, Flagstaff, Arizona, p 158-162. 2 ref.

Descriptors: *Water law, *Prior appropriation, *Water rights, *Water policy, *Water resources development, *Beneficial use, Appropriation, Preferences(Water rights), Riparian rights, Water resources, Common law, Governments, Administrative agencies, Priorities, Planning, Reasonable use, Water utilization, Alternative water use, Water supply, *Institutional constraints.

Planning and development of water resources in the western United States must be based on an understanding of many factors, among which is the complex water law system called the Appropriation Doctrine. The two basic principles involved in the doctrine of prior appropriation are that beneficial use of the water gives the basis of the right to use the water, and that priority of use, not equality of right, determines allocation when there is not enough water to satisfy all appropriations. Under the Appropriation Doctrine, land ownership does not give the right to use water as does the riparian system. The problem is that those who beneficially used the water first, regardless of type of use or efficiency, obtained a perpetual right to always be first. The Appropriation Doctrine is changing along with the water allocations system as new water-use priorities emerge along with changing quality standards. Government at all levels, along with planners and engineers, must understand the institutional and legal constraints put on water development by the historic water rights system so that intelligent decisions can be made in developing and maintaining natural water resources. OPTIMAL LEASING POLICY FOR THE DEVELOPMENT OF OUTER CONTINENTAL SHELF HYDROCARBON RESOURCES,
Amos Tuck School of Business Administration, Hanover, N.H.
D. E. Logue, R. J. Sweeney, and T. D. Willett.
Land Economics, Vol L1, No 3, p 191-207, 1975. 1 fig, 18 ref.

Descriptors: *Oil, *Leases, Continental shelf, Pricing, Competition, United States, Exploitation, Bids, Royalties, Profit, Risks, Return(Monetary), Economic efficiency.
Identifiers: Government policy, Allocation, Government revenue, Depletion allowance, Cash-bonus bids.

The current U.S. leasing policy for hydrocarbon exploration on the Outer Continental Shelf is described as well as the rate of lease offerings and determining the allocation of leases. The conclusions are that competitive bidding appears the norm for offshore leases. Alternative allocation plans are examined; the present cash-bonus bid system is favored as it yields the greatest revenue for the government, but it could be modified to allow for installment payments. A royalty system may yield more revenue but may also lead to premature shut-down of production and is not favored. The rate of offering of areas for lease could be accelerated which may lead to more competitive pressures and increase production. (Carpenter-Wisconsin)

ENVIRONMENTAL CONSIDERATIONS IN FUTURE ENERGY GROWTH.
Battelle Columbus Lab., Ohio.
Available from the National Technical Information Service, Springfield Va 22161 as PB239-157, $16.25 in paper copy, $2.25 in microfiche. Report No EPA-600/5-73-004, April 1973. 631 p, 71 fig, 182 tab, 362 ref. EPA 68-01-0470.

Descriptors: *Environmental effects, *Energy conversion, *Costs, *Pollutants, *Pollution abatement, Effluents, Fuels, Decision making, Air pollution, Water pollution, Coals, Natural gas, Solid wastes, Oil, Technology, Alternative planning, Nuclear energy, Computer programs, Electric power production, Heating, Nuclear wastes, Solar radiation, Tides, Thermal powerplants, Insulation, Fossil fuels, Separation techniques, Transportation, Storage, Consumptive use.
Identifiers: Emissions, Energy systems pollution potential, Energy emissions inventory, Nuclear fusion, Geothermal energy, Fuel cells, Waste heat utilization.

The environmental burdens associated with uses of alternative fuel sources for energy generation are compiled and ranked as to their pollution potential. Details are given for emissions, water pollution, and solid waste generation during extracting and cleaning, transport, storage, conversion, processing of fractions, utilization processes, and pollution control costs, development costs for fossil fuels and nuclear energy systems. These are ranked by computer programs to facilitate evaluation of any energy system by testing preferred weighting factors. In order to establish which other energy systems should have preferential development, the environmental impact, energy potential, development costs, capital costs, and cost of converting energy were investigated for fuel cells, solar, tidal, fusion, breeder reactors, hydrogen, geothermal, energy storage, magnetohydrodynamics, thermoelectric, thermionic, waste heat recovery, space heating, insulation, and heat pumps, and all are ranked environmentally. Those judged to exhibit major potential for supplying significant portions of future energy with reduced environmental impact are geothermal, solar, and nuclear fusion. Air emissions from coal-based systems can be reduced by application of advanced technology while minimizing the attendant increase in solid wastes. Technology advances will be able to minimize the water and solid waste burdens produced through coal utilization. (Auen-Wisconsin)

In much of the western United States a lar of the utilized water comes from accu mountain snowpacks; thus, accurate m ments of snow distributions are required fo to streamflow prediction models. The appl of ERTS imagery for mapping snow was ev for two geographic areas, the Salt Watershed in central Arizona and the so Sierra Nevada in California. Technique developed to identify snow and to differ between snow and cloud. The snow ext these two drainage areas was mapped fr MSS-5 (0.6-0.7 micrometer) imagery and pared with aerial survey snow charts, photography, and ground-based snow m ments. Based on the results of the complet analyses, it was concluded that the amoun formation in ERTS imagery with practical a tion to snow mapping is substantial. The

e snow extent maps of the 5601 sq km Amer-River basin were prepared using a Zoom nsfer Scope from ERTS-1 MSS band 4 gery. The maps were generally completed hin one hour. A snow melt curve based on TS-1 imagery was used as a 'calibration' stan-d or comparison for maps prepared from AA-2 VHRR imagery in the same manner. t comparisons with U-2 derived imagery in-ated that ERTS-1 snow mapping of the basins ix times faster. Conservative estimates of com-able aircraft snow survey flights yields a cost re 200 times that of the ERTS-1 snow map. w mapping attempts in the Lake Ontario basin nonstrated that ERTS-1 is not well suited to e basins. Optimum size of basins for ERTS dies is believed to range from about 250 sq km 0,000 sq km. The value of the ERTS-1 MSS for at Lake ice evaluation was proved during the t winter on Lake Erie. Not only were ice fea-es and types of ice identified, but melting ice s detected through the combined use of band 5 -0.7 micrometer) and band 7 (0.8-1.1 microme-. Ice movement (direction and speed) was pped by examining imagery from two succes-e days. The resolution of NOAA-2's VHRR s checked by comparison of ice leads as seen in MSS band 5. ntifiers: *ERTS.

e Double Lakes playas complex in Lynn Coun-Texas, was instrumented as an ERTS-1 test site. Color composites using an electronic density profile have been particularly useful for distinguishing the exact water area from the muddy areas of the Double Lakes playas, and for determining the salt crust areas. Color composites also portray gradations in water transparency due to depth fluctuations, suspended sediment, or algae much better than the single MSS bands. Analysis of Bands 6 and 7 of ERTS-1 MSS imagery, showed that lake basins as small as 200 m in diameter (+ or - 10 acres) can be reliably classified as being 'wet' or 'dry', thus supplying the methodology for a rapid, periodic census of surface water. Identifiers: *ERTS, Sensors, Data collection plantforms.

The Water Survey of Canada operates a network of approximately 2400 gaging stations at which water level data are collected. In most cases the water level data are used in conjunction with periodic discharge measurements to produce daily river discharge data. In many cases it would be desirable to obtain data on a near real time basis. However, the isolated locations of most of the gaging stations have made the cost of land line telemetry prohibitive. Therefore, when the ERTS Data Collection System became available in 1972 it seemed worthwhile to investigate the possibility of using a satellite retransmission system to collect discrete water level readings at least once daily from a few gaging stations and to use these data for operational purposes. To perform this assessment, nine Data Collection Platforms (DCPs) were installed in isolated areas of northern and western Canada. Results of the project have been excellent. There has been no data loss that can be attributed to failure of a DCP, although data were lost because of sensor malfunctions. The quality of data collected compares favorably with that of the hard record obtained at the remote sites. Costs of using the ERTS Data Collection System are reasonable. Identifiers: *ERTS.

The Spring 1973 Mississippi River flood was investigated using remotely sensed data from ERTS-1. Both manual and automatic analyses of the data indicated that ERTS-1 is extremely useful as a regional tool for flood and floodplain management. Automatic digital analysis using the GEMS system was employed to obtain quantitative estimates of area flooded in small test sites 1225 sq km in area in St. Charles County, Missouri, and the delta region of northwest Mississippi. In the St. Charles site 265 sq km (21% of the total area) was calculated to be flooded; whereas, in the northwest Mississippi site, 480 sq km (39%) was inundated with an additional amount of high forest submerged beneath the canopy. In the entire state of Arkansas, manual photo interpretation indicated that 7300 sq km was inundated with only 630 sq km flooded along the Mississippi River mainstem. The maximum error of such flood area measurements was conservatively estimated to be less than 5%. Change detection analysis indicated that the flood had major impacts on soil moisture, land pattern stability, and vegetation stress. (See also W76-02026) (Sims-ISWS)

APPLICATION OF ERTS IMAGERY TO ENVIRONMENTAL STUDIES OF LAKE CHAMPLAIN,
Vermont Univ., Burlington.
A. O. Lind.
In: Third Earth Resources Technology Satellite-1 Symposium, Volume 1: Technical Presentation, Section B, NASA SP-351, Proceedings of Symposium held December 10-14, 1973, Washington, D.C., p 1189-1196, 1974. 8 fig, 1 ref.

Descriptors: *Satellites(Artificial), *Remote sensing, *Lakes, *Environment, *Vermont, *New York, Water pollution, Floods, Turbidity, Lake ice, Pulp and paper industry, Effluents, Industrial wastes, Erosion, Shores, Legal aspects.
Identifiers: *ERTS, *Lake Champlain(Vt).

ERTS imagery has provided data relating to a number of environmental and limnological concerns such as water quality, lake flooding, and lake ice formation. Pollution plume data provided by ERTS was recently used in the Supreme Court case involving the states of Vermont and New York and a paper company. Flooding of lowland tracts has been a major concern due to a repetitive pattern of high lake levels over the past three years, and ERTS imagery is being used to construct the first series of flood maps of the affected areas. Lake ice development and turbidity patterns have also been studied from ERTS, since these have significance for shore erosion studies. (See also W76-02026) (Sims-ISWS)

Identifiers: *ERTS, Data collection platforms.

LIBRARY U. OF I. URBANA CHAMPAIGN

The New England region is comprised of several small watersheds, draining hilly terrain. With the high density population centers in the southern three states come the perennial problems of flood damage and flood protection. Because of the high development that has taken place along the main stems of rivers since the industrial revolution, nearly all the reservoirs are situated on tributaries where time of concentration and reaction time from rainfall to floodflows are short. In 1969, the New England Division, Corps of Engineers, installed an Automatic Hydrologic Radio Reporting Network consisting of 41 remote reporting stations and controlled by a computer to help in the regulating its flood protection system. Data collection Platforms (DCPs) have been installed throughout the New England area from Fort Kent, Maine, to Stanford, Connecticut. The sites were selected to provide an overall assessment of environmental conditions. Results showed that the DCPs are reliable and useful. Satellite data collection appears feasible on a nationwide basis. (See also W76-02026) (Sims-ISWS)

APPLICATIONS OF ERTS DATA TO COASTAL WETLAND ECOLOGY WITH SPECIAL REFERENCE TO PLANT COMMUNITY MAPPING AND TYPING AND IMPACT OF MAN,
American Univ., Washington, D.C., Dept. of Biology.
R. R. Anderson, V. Carter, and J. McGinnis.
In: Third Earth Resources Technology Satellite-1 Symposium, Volume 1: Technical Presentations, Section B, NASA SP-351, Proceedings of Symposium held December 10-14, 1973, Washington, D.C., p 1225-1242, 1974. 13 fig, 4 ref.

Descriptors: *Satellites(Artificial), *Remote sensing, *Wetlands, *Ecology, *Atlantic Coatal Plain, Coasts, Analytical techniques, Data processing, Vegetation, Coastal marshes, Marshes, Marsh plants, Mapping, Marsh management, Dredging, Highways, Drainage, Lagoons, Swamps, Shallow water.
Identifiers: *ERTS, Wetlands type.

Complete seasonal ERTS-1 coverage of Atlantic coastal wetlands from Delaware Bay to Georgia provided a basis for assessment of temporal data for wetland mapping, evaluation, and monitoring. Both MSS imagery and digital data have proved useful for gross wetland species delineation and determination of the upper wetland boundary. Tidal effects and (band to band or seasonal) spectral reflectance differences made it possible to type vegetatively coastal wetlands in salinity related categories. Management areas, spoil disposal sites, drainage ditches, lagoon-type developments and highway construction can be detected, indicated a monitoring potential for the future. (See also W76-02026) (Sims-ISWS)
W76-02036

INVENTORIES OF DELAWARE'S COASTAL VEGETATION AND LAND-USE UTILIZING DIGITAL PROCESSING OF ERTS-1 IMAGERY,
Delaware Univ., Newark. Coll. of Marine Studies.
V. Klemas, D. Bartlett, R. Rogers, and L. Reed.
In: Third Earth Resources Technology Satellite-1 Symposium, Volume 1: Technical Presenations, Section B, NASA SP-351, Proceedings of Symposium held December 10-14, 1973, Washington, D.C., p 1243-1255, 1974. 3 fig, 3 tab, 5 ref.

Descriptors: *Satellites(Artificial), *Remote sensing, *Vegetation, *Land use, *Delaware, *Coasts, Coastal plains, Coastal marshes, Wetlands, Marshes, Marsh plants, Shoreline cover, Grasses, Data processing, Analytical techniques, Computers, Land management, Surveys, Mapping, Agriculture, Urbanization.
Identifiers: *ERTS.

Digital analysis of ERTS-1 imagery was used in an attempt to map and inventory the significant ecological communities of Delaware's coastal zone. Eight vegetation and land use discrimination classes were selected as follows: (1) Phragmites communis (Giant Reed grass), (2) Spartina alterniflora (Salt marsh cord grass), (3) Spartina patens (Salt marsh hay), (4) shallow water and exposed mud, (5) deep water (less than 2 meters), (6) forest, (7) agriculture, and (8) exposed sand concrete. Canonical analysis showed that classification accuracy was quite good with Spartina alterniflora; exposed sand, concrete, and forested land were all discriminated with between 94% and 100% accuracy. The shallow water-mud and deep water categories were classified with accuracies of 88% and 93% respectively, with all errors in classification occurring as one water category being classed as the other. Phragmites cummunis showed a classification accuracy of 83% with all confusion occurring with Spartina patens which may be due to use of mixed stands of these species as training sets. Discrimination of Spartina patens was very poor (accuracy equals 52%) due to difficulties in locating large, pure stands of S. patens for use as training sets. Classification accuracy for agriculture was also very poor (51%). (See also W76-02026) (Sims-ISWS)

RELATIONSHIPS BETWEEN ERTS RADIANCES AND GRADIENTS ACROSS OCEANIC FRONTS,
National Oceanic and Atmospheric Administration, Miami, Fla. Atlantic Oceanographic and Meteorological Lab.
G. A. Maul, and H. R. Gordon.
In: Third Earth Resources Technology Satellite-1 Symposium, Volume 1: Technical Presentations, Section B, NASA SP-351, Proceedings of Symposium held December 10-14, 1973, Washington, D.C., p 1279-1308, 1974. 13 fig, 1 tab, 20 ref.

Descriptors: *Satellites(Artificial), *Remote sensing, *Ocean currents, *Gulf of Mexico, Data processing, Analytical techniques, Reflectance, Color, Chlorophyll, Plankton, Salinity, Temperature, Oceans, Oceanography.
Identifiers: *ERTS, Loop current, Fronts(Oceanic).

A time series of the Loop Current in the Gulf of Mexico, covering an annual cycle of growth, spreading and decay, has been obtained in synchronization with ERTS. Computer enhanced images, which are necessary to extract useful oceanic information, showed that the current can be observed either by color or sea state effects associated withe the cyclonic boundary. The color effect related to the spectral variations in the optical properties of the water and its suspended particles, and was studied by radiative transfer theory. Significant oceanic parameters identified were the probability of forward scattering and the ratio of scattering to total attenuation. Several spectra of upwelling diffuse light were computed as a function of the concentration of particles and yellow substance. These calculations compared favorably with experimental measurements and showed that the ratio of channels method give ambiguous interpretative results. The results were used to discuss features in images where surface measurements were obtained and were extended to tentative explanation in others. (See also W76-02026) (Sims-ISWS)

OCEAN INTERNAL WAVES OFF THE NO AMERICAN AND AFRICAN COASTS F ERTS-1,
National Oceanic and Atmospheric Admin tion, Miami, Fla. Atlantic Oceanographic Meteorological Lab.
J. R. Apel, and R. L. Charnell
In: Third Earth Resources Technology Satel Symposium, Volume 1: Technical Presentat Section B, NASA SP-351, Proceedings of posium held December 10-14, 1973, Washin D.C., p 1309-1316, 1974. 4 fig.

Descriptors: *Satellites(Artificial), *Re sensing, *Internal waves, *Atlantic O *Africa, Oceans, Waves(Water), Ocean w Wavelengths, Continental shelf, Anal techniques, Data processing, Oceanography.
Identifiers: *ERTS, *New York Bight.

Periodic features observed in the ocean por of certain ERTS-1 images have been iden with reasonable certainty as surface manif tions of oceanic internal gravity waves. A seri images taken over the New York Bight, comm ing in July 1972 and continuing on into autum 1973, has shown the internal waves to be pr when summer solar heating stratifies the sufficiently well to support such oscilla When fall and winter wind action mixes the water down to the bottom, the waves no longe pear. In the Bight, the wavelengths range fro proximately 400 to 1000 m, with the wave being most sharply delineated near the edg the continental shelf, at the mouth of the Hu Canyon. They appear in packets consistin several waves separated by 10-15 km, propagate up on the shelf and disappear. waves have also been detected off the east west coasts of Africa, where the wavelength proach 4 km. On the western continental they appear in packets separated by 30-40 km are highly phase-oriented parallel to the bo shelf topography. (See also W76-02026) (S ISWS)

A REVIEW OF INITIAL INVESTIGATIONS UTILIZE ERTS-1 DATA IN DETERMIN THE AVAILABILITY AND DISTRIBUTION LIVING MARINE RESOURCES,
National Marine Fisheries Service, Bay Louis, Miss. Fisheries Engineering Lab.
W. H. Stevenson, A. J. Kemmerer, B. H. Atw and P. M. Maughan.
In: Third Earth Resources Technology Satel Symposium, Volume 1: Technical Presentat Section B. NASA SP-351, Proceedings of posium held December 10-14, 1973, Washin D.C., p 1317-1331, 1974. 9 fig, 8 ref.

Descriptors: *Satellites(Artificial), *Re sensing, *Marine fisheries, *Aerial photogra *Gulf of Mexico, Data processing, Fish, Atl menhaden, Fisheries, Commercial fis Estuarine fisheries, Estuaries, Fish populatio
Identifiers: *ERTS, *Mississippi Sound.

A 15-month study was initiated in July 1972 t determine the reliability of satellite and hig titude sensors to provide data about oce graphic parameters in coastal waters, (2) de strate the use of remotely sensed oceanogra information to predict the distribution abundance of adult menhaden, and (3) de strate the potential of using satellite-acquire formation for improving the harvest and mar ment of a fishery resource. The study focuse coastal areas in the north central portion o Gulf of Mexico including parts of Alabama, sissippi and Louisiana. The area used in the analysis was limited to the Mississippi Sound proximately 145 kilometers long and 16 kilom wide, with an average water depth of about 3.7 ters, and in general characterizes an estuarin vironment. A small industrial fish, comm called menhaden, was selected as the target

Menhaden were selected because their sur- schooling pelagic nature makes them well d to satellite and aircraft remote sensing, and use they support an important commercial ry actively pursuing advanced technology to e varied problems. It was shown that relation- exist between certain oceanographic meters and the distribution of menhaden, and these relationships may have potential appli- n for commercial fishing and resource assess- . ATING COASTAL AND NAVIGATIONAL RTS USING ERTS-1 DATA,
ronmental Research Inst. of Michigan, Ann r.
Polcyn, and D. R. Lyzenga.
Third Earth Resources Technology Satellite-1 posium, Volume 1: Technical Presentations, ion B. NASA SP-351, Proceedings of Sym- um held December 10-14, 1973, Washington, , p1333-1346, 1974, 10 fig, 2 tab, 3 ref.

riptors: *Satellites(Artificial), *Remote ing, *Navigation, *Maps, *Lake Michigan, h hydrography, Navigable waters, Shoals, low waters, Ships, Hazards, Charts, Mapping, eys, Erosion, Sedimentation, Lakes, Oceans, processing.
tifiers: *ERTS, *Little Bahama Bank.

ccessful processing algorithm for extracting r depth information from ERTS data has been loped. Depth charts for two geographical s have been constructed representing different illumination and water transparency condi- . Absolute depth calculations for water depth 5 fathoms have been demonstrated for the Lit- Bahama Bank. Depth Charts also were con- ted using data in Band 4 and 5 of the ERTS-1 for areas in Lake Michigan. This data esented a low sun angle, poor light transmis- in water conditions and gave useful results to eters. In both cases, the ERTS map esented an update in shallow water detail in parison with available navigation charts for areas tested. (See also W76-02026) (Sims- S)

IMENT CONCENTRATION MAPPING IN AL ESTUARIES,
y Engineer Waterways Experiment Station, sburg, Miss. Mobility and Environmental ems Lab.
. Williamson, and W. E. Grabau.
Third Earth Resources Technology Satellite-1 posium, Volume 1: Technical Presentations, ion B. NASA SP-351, Proceedings of Sym- um held December 10-14, 1973, Washington, , p1347-1386, 1974. 25 fig, 1 ref.

riptors: *Satellites(Artificial), *Remote ing, *Estuaries, *Sediment load, *Southeast , *Chesapeake Bay, Data processing, Analyti- techniques, Spectrophotometry, Suspended s, Sediment discharge, Effluents, Bodies of r, Surface waters, Rivers, Lakes, Mapping.
ifiers: *ERTS, Spectrum matching.

nalytical procedure has been developed that iders the ERTS-1 multispectral scanner as a ctance spectrophotometer. ADP techniques iring only very limited computer capability utilized to search the data defining the spec- reflectance characteristics of a scene on a -by-pixel basis, identify each pixel whose tral reflectance matches a reference spec- , and generate maps that identify pixel loca- where spectrum matches occur and the spec- that was matched. If the reference spectra nown to represent a specific condition on the nd, a map of the distribution of that condition e out-put as a dimensionally accurate overlay aps of any selected scale. Two applications were described in this report: (1) mapping the distribution of water masses exhibiting specific suspended sediment concentrations, and (2) determining the location and delineation of surface water bodies in the southeastern U.S. (See also W76-02026) (Sims-ISWS)
W76-02043

MONITORING COASTAL WATER PROPERTIES AND CURRENT CIRCULATION WITH ERTS-1,
Delaware Univ., Newark.
V. Klemas, M. Otley, C. Wethe, and R. Rogers.
In: Third Earth Resources Technology Satellite-1 Symposium, Volume 1: Technical Presentations, Section B. NASA SP-351, Proceedings of Symposium held December 10-14, 1973, Washington, D.C., p 1387-1411, 18 fig, 1 tab, 15 ref.

Descriptors: *Satellites(Artificial), *Remote sensing, *Bays, *Estuaries, *Delaware, *New Jersey, Circulation, Turbidity, Currents(Water), Waste disposal, Sediments, Suspended solids, Tides, Tidal waters, Tidal bores, Data processing, Analytical techniques, On-site investigations.
Identifiers: *ERTS, *Delaware Bay, Convergent boundaries.

Imagery and digital tapes from nine successful ERTS-1 passes over Delaware Bay during different portions of the tidal cycle have been analyzed with special emphasis on turbidity, current circulation, waste disposal plumes, and convergent boundaries between different water masses. ERTS-1 image radiance correlated well with Secchi depth and suspended sediment concentration. Circulation patterns observed by ERTS-1 during different parts of the tidal cycle agreed well with predicted and measured currents throughout Delaware Bay. Convergent shear boundaries between different water masses were observed from ERTS-1. In several ERTS-1 frames, waste disposal plumes have been detected 36 miles off Delaware's Atlantic coast. The ERTS-1 results are being used to extend and verify hydrodynamic models of the bay, developed for predicting oil slick movement and estimating sediment transport. (See also W76-02026) (Sims-ISWS)

CALIFORNIA COASTAL PROCESSES STUDY,
Corps of Engineers, San Francisco, Calif. South Pacific Div.
D. M. Pirie, and D. D. Steller.
In: Third Earth Resources Technology Satellite-1 Symposium, Volume 1: Technical Presentations, Section B. NASA SP-351, Proceedings of Symposium held December 10-14, 1973, Washington, D.C., p 1413-1446, 1974, 15 fig, 1 tab, 17 ref.

Descriptors: *Satellites(Artificial), *Remote sensing, *California, *Coasts, Estuaries, Bays, Rivers, Discharge(Water), Sediments, Currents(Water), Sediment transport, Upwelling, Suspended solids, Turbidity, Seasonal, Planning, Construction, Data processing, Analytical techniques, Aerial photography.
Identifiers: *ERTS.

Preliminary findings and applications derived from ERTS-1 satellite imagery of the nearshore coastal processes of the California coast were presented. Objectives were to analyze nearshore currents, sediment transport, and estuarine and river discharges along the California coast through the use of synoptic and repetitive imagery from ERTS as well as aircraft underflights and surface data. The major conclusions were: (1) distinct seasonal patterns for sediment transport as a function of the oceanic current systems and coastal morphology have been identified; (2) large scale sediment plumes from intermittent streams and rivers extend offshore to previously unanticipated ranges, and areas where these plumes contain possible contamination from onshore activities can be traced in detail; (3) computer-generated contouring of radiance levels from computer-compatible tapes result in charts that can be used for determination of surface and nearsurface suspended sediment distribution; (4) flying spot scanner enhancement results in details of nearshore features; and (5) data from this ERTS study is providing significant information for coastal planning and construction projects. THE UTILIZATION OF ERTS-1 DATA FOR THE STUDY OF THE FRENCH ATLANTIC LITTORAL,
Institut Geographique National, Paris (France).
P. G. Demathieu, and F. H. Verger.
In: Third Earth Resources Technology Satellite-1 Symposium, Volume 1: Technical Presentations, Section B. NASA SP-351, Proceedings of Symposium held December 10-14, 1973, Washington, D.C., p 1447-1450, 1974. 1 fig.

Descriptors: *Satellites(Artificial), *Remote sensing, *Coasts, *Atlantic Ocean, Littoral, Geomorphology, Rivers, Estuaries, Turbidity, Sediments, Ocean currents, Currents(Water), Data processing, Analytical techniques.
Identifiers: *ERTS, *France, *Loire River.

The French Atlantic Littoral (FRALIT) program uses ERTS-1 data to study coastal geomorphology and waters. ERTS-1 gives an overall picture of the phenomena for the first time due mainly to channel 4 data, but the other channels also contribute valuable complementary data on superficial waters. These studies have already resulted in accurate maps of the mud transported southwestward from the mouth of the River Loire. (See also W76-02026) (Sims-ISWS)
W76-02046

MONITORING ARCTIC SEA ICE USING ERTS IMAGERY,
Environmental Research and Technology, Inc. Lexington, Mass.
J. C. Barnes, and C. J. Bowley.
In: Third Earth Resources Technology Satellite-1 Symposium, Volume 1: Technical Presentations, Section B. NASA SP-351, Proceedings of Symposium held December 10-14, 1973, Washington, D.C., p 1453-1465, 1974, 9 fig, 13 ref.

Descriptors: *Satellites(Artificial), *Remote sensing, *Sea ice, *Arctic Ocean, Monitoring, Surveys, Ice, Arctic, Cold regions, Ice cover, Analytical techniques, Aerial photography, Infrared radiation, Mapping.
Identifiers: *ERTS, *Beaufort Sea, *Bering Sea.

Because of the effect of sea ice on the heat balance of the Arctic and because of the expanding economic interest in arctic oil and other minerals, extensive monitoring and further study of sea ice is required. The application of ERTS data for mapping ice was evaluated for several arctic areas, including the Bering Sea, the eastern Beaufort Sea, parts of the Canadian Archipelago, and the Greenland Sea. Interpretive techniques were discussed, and the scales and types of ice features that can be detected were described. For the Bering Sea, a sample of ERTS imagery was compared with visual ice reports and aerial photography from the NASA CV-990 aircraft. Essentially all of the significant ice features near St. Lawrence Island visible in the aerial photographs taken from the CV-990 can also be detected in the ERTS imagery. It seem entirely feasible, therefore, that ERTS imagery could be used to replace some currently flown aerial surveys, at a considerable cost saving. (See also W76-02026) (Sims-ISWS)

LIBRARY U. OF I. URBANA-CHAMPAIGN

APPLICABILITY OF ERTS TO ANTARACTIC ICEBERG RESOURCES,
Rand Corp., Santa Monica, Calif.
J. L. Hult, and N. C. Ostrander.
In: Third Earth Resources Technology Satellite-1 Symposium, Volume 1: Technical Presentations, Section B. NASA SP-351, Proceedings of Symposium held December 10-14, 1973, Washington, D.C., p1467-1490, 6 fig, 8 ref.

Descriptors: *Satellites(Artificial), *Remote sensing, *Icebergs, *Water resources, *Antarctic Ocean, *Antarctic, Cold regions, Water supply, Ice, Sea ice, Transportation, Harvesting, Monitoring, Surveys, Cloud cover.
Identifiers: *ERTS.

The applicability of ERTS to determine tha Antarctic sea-ice and environmental behavior that may influence the harvesting of icebergs, and to monitor iceberg locations, characteristics, and evolution was explored. Imagery sampling in the estern Antarctic between the Peninsula and the Ross Sea was used in the analysis. It was found that the potential applicability of ERTS to the research, planning, and harvesting operations can contribute importantly to the promise derived from broader scope studies for the use of Antarctic icebergs to relieve a growing global need for fresh water. Live Antarctic readout will permit timely acquisition of imagery on every orbital pass, which will be necessary to achieve adequate glimpses through the 80% cloud cover. Thermal sensor bands will provide coverage in daylight or darkness. Several years of comprehensive monitoring will be necessary to characterize sea-ice and environmental behavior and iceberg evolution. Live ERTS services will assist harvesting control and claiming operations and offer a means for harmonizing entitlements to iceberg resources. The valuable ERTS services will be more cost effective than other means and will be easily justified and borne by the iceberg harvesting operations. (See also W76-02026) (Sims-ISWS)
W76-02048

APPLICATIONS OF ERTS-1 IMAGERY TO TERRESTRIAL AND MARINE ENVIRONMENTAL ANALYSES IN ALASKA,
Cold Regions Research and Engineering Lab., Hanover, N.H.
D. M. Anderson, H. L. McKim, W. K. Crowder, R. K. Haugen, and L. W. Gatto.
In: Third Earth Resources Technology Satellite-1 Symposium, Volume 1: Technical Presentations, Section B. NASA SP-351, Proceedings of Symposium held December 10-14, 1973, Washington, D.C., p 1575-1606, 1974. 12 fig, 1 tab, 32 ref.

Descriptors: *Satellites(Artificial), *Remote sensing, *Environment, *Alaska, Estuaries, Estuarine environment, Coasts, Tides,Pipelines, Oil spills, Geology, Rivers, Ice, Ice jams, Vegetation, Permafrost, Sea ice, Cold regions.
Identifiers: *ERTS.

ERTS-1 imagery provides a means of distinguishing and monitoring estuarine surface water circulation patterns and changes in the relative sediment load of discharging rivers on a regional basis. This information is being used to produce a data base useful in regional planning and in the development of management programs as required by the Coastal Zone Management Act of 1972. It also will aid local fishing industries by augmenting currently available hydrologic and navigation charts. The interpretation of geologic and vegetation features resulted in preparation of improved surficial geology, vegetation, and permafrost terrain maps at a scale of 1:1 million utilizing ERTS-1 Band 7 imagery. The maps will be used in a route and site selection study for the Nome to Kobuk Road in central Alaska. Large river icings along the proposed Alaska pipeline route have been monitored. Sea ice deformation and drift northeast of Point Barrow, Alaska, has been measured during a four-day period in March and shorefast ice accumulation, and ablation along the west coast of Alaska is being mapped for the spring and early summer seasons. These data will be used for route and site selection, regional environmental analysis, identification and inventory of natural resources, land use planning, and in land use regulation and management. AN INTERDISCIPLINARY STUDY OF THE ESTUARINE AND COASTAL OCEANOGRAPHY OF BLOCK ISLAND SOUND AND ADJACENT NEW YORK COASTAL WATERS,
Long Island Univ., Greenvale, N. Y.
E. Yost, R. Hollman, J. Alexander, and R. Nuzzi.
In: Third Earth Resources Technology Satellite-1 Symposium, Volume 1: Technical Presentations, Section B. NASA SP-351, Proceedings of Symposium held December 10-14, 1973, Washington, D.C., p 1607-1618, 1974. 12 fig, 1 tab, 1 ref.

Descriptors: *Satellites(Artificial), *Remote sensing, *Estuaries, *New York, Coasts, Sampling, Water quality, Suspended solids, Sediments, Density, Turbidity, Chlorophyll, Data processing, Analytical techniques, Regression analysis, Oceanography
Identifiers: *ERTS, *Block Island Sound(NY), *New York Bight, Extinction coefficient.

ERTS-1 photographic data products have been analyzed using additive color viewing and electronic image analysis techniques. Satellite data were compared to water sample data collected simultaneously with the data of ERTS-1 coverage in New York Bight. Prediction of the absolute value of total suspended particles can be made using composites of positive of MSS bands 5 and 6 which have been precisely made using the step wedge supplied on the imagery. Predictions of the relative value of the extinction coefficient can be made using bands 4 and 5. Thematic charts of total suspended particles (particles per litre) and extinction coefficient provide scientists conducting state and federal water sampling programs in New York Bight with data which improves the performance of these programs. OTE-SENSING TECHNIQUES FOR RMINING WATER TABLE DEPTHS IN GATED AGRICULTURE,
Lidster, F. A. Schmer, D. W. Ryland, and Moore.
apers from the Fall Convention, American y of Photogrammetry, October 26-31, 1975, Church, Virginia, p 821-838, (1975). 2 fig, 9 ref.

iptors: *Remote sensing, *Water table, ated land, *Aerial photography, *Water Drains, Irrigation systems, Hydrologic Land management, Terrain analysis, Data tions, *Kansas, Agriculture, Irrigation, ge systems, Surveys, Regression analysis. fiers: LANDSAT-1.

s are described to evaluate the applicability mote sensing for determination of water as an aid in the detection of internal ge problems related to irrigation in an ir- d region in North-Central Kansas. Aerial ere collected by LANDSAT-1 and aircraft he Kansas/Bostwick Irrigation District in lic and Jewell Counties, Kansas (an are of imately 400 sq km). Significant correlations obtained between water table depths and SAT-1 and aircraft data for the total area of study and for specific fields. Analysis of a corn field resulted in the correct classification of91 percent of the water tables into depths less than 183 cm and depths greater than 183 cm. Multiple regression equations developed for specific corn fields showed that LANDSAT-1 data for two dates (May and August, 1973) provided a reliable prediction of water table depths. Results were not consistent for aircraft data for specific fields. Significant correlations were obtained for the black and white film exposed with a red filter versus water table depth for 4 of the fields studied. (Robinett-Arizona)

In: Papers from the Fall Convention, American Society of Photogrammetry, October 26-31, 1975, Falls Church, Virginia, p 413-436, (1975), 12 fig, 10 tab, 10 ref.

Descriptors: *Remote sensing, *Hydrologic data, *Runoff forecasting, *Watersheds(Basins), *Snow cover, Hydrology Data collections, Climatic data, Surveys, *Washington, Geology, Vegetation, Land use, Groundwater, Water sources, Snowpacks, Snow cover, Runoff, Clouds, Rivers, Urbanization, Meteorology, Cloud cover.
Identifiers: LANDSAT-1 imagery, Snow lines, *Nisqually River Basin(Wash).

The study was done on the Nisqually River Basin situated generally to the southeast of Puget Sound in Western Washington. Using LANDSAT-1 images, it was possible to gather data on general geology, land-use and vegetation parameters, groundwater sources, seasonal snow lines and snow pack, algae, and sediment patterns. Land-use classifications for level 1 (urban and built-up) was compared to recent U.S. Geological Surveys maps and the resulting data are presented in runoff change estimation for preliminary engineering design. For the study using LANDSAT-1 imagery (1:1,000,000) in MSS bands 4, 5, 6, and 7, the following were identified as items of concern: watershed determination and related studies; river characteristics; land-use characteristics; and atmospheric characteristics. The major problems encountered with imagery uses for engineering studies are: delay in obtaining coverage; cloud frequency expectation; vegetation cover; and shadow in vegetation and snow in areas of high relief and scale. However, the multi-data imagery is helpful in snow line variation and in changes in runoff prediction. (Robinett-Arizona)

REMOTE SENSING AS AN AID TO COMMUNITY DEVELOPMENT IN AN ARID AREA,
Arizona Univ., Tucson. Office of Arid Lands Studies.
K. E. Foster, and R. N. Weisz.
In: Papers from the Fall Convention, American Society of Photogrammetry, October 26-31, 1975, Falls Church, Virginia, p 856-875, (1975), 12 fig, 6 tab.

Descriptors: *Remote sensing, *Hydrologic data, *Mapping, *Arid lands, *Planning, *Land management, *Computer programs, Photography, Aerial photography, Flood plain zoning, Maps, Surveys, Flood protection, Flood control, Hydrology, Flood plains, Terrain analysis, Watersheds(Basins), Data collections, Arizona, Water sources, Computers, Data processing, Land development, Land use, Vegetation, Topography, Water supply, Groundwater recharge, Natural resources, Semiarid climates, Urbanization.
Identifiers: *High-altitude infrared photography, Vegetation distribution, Soils distribution, Tucson(Ariz).

The objective was to improve the staff decision-making base by utilizing remotely sensed data to aid in the land-planning process for an approximate 70,000-acre site north of Tucson, Arizona. NASA high-altitude color infrared photography of the area was enlarged to a scale of 1:31,680 (2 inch equals 1 mile). Laboratory mapping and field work were combined to produce 5 natural resource maps of the area including existing land use, vegetation distribution, slope, groundwater recharge zones, and soils distribution maps. These 5 maps were digitized and entered into a computer program to overlay multiple maps which allowed evaluation of the combined environmental effects of the mapped resources simultaneously for urban development suitability. The suitability criteria were based on new construction starts on soil types free of flooding potential, slopes less than 5 percent, urban areas located in nonunique vegetation types, and sufficient water available for human consumption. Descriptors: *Remote sensing, *Flood plain zoning, *Flood protection, *Arizona, *Aerial photography, Regulation, Flood plains, Geomorphology, Flood data, Maximum probable flood, Instrumentation, Mapping, Surveys, Soils, Soil types, Vegetation, Hydrologic data, Historic floods, Soil horizons.
Identifiers: Cochise County(Ariz), Earth Resource Technology Satellite(ERTS-1).

Population pressures on the land resources of Arizona have led to the sale and development of areas subject to flooding and because of the inadequacy of land use controls, the area is open to various land speculation schemes and unplanned subdivision growth. A floodplain delineation project was conducted for the Planning Department of Cochise County, Arizona, in which imagery acquired by Earth Resources Technology Satellite (ERT-1) and by high-altitude aircraft was employed. Parameters of the analysis included soils and geomorphology, vegetation, hydrologic calculations, and historical data. Floodplain soils lack developed B horizons, as compared to older, more mature soils not subject to flooding. General soil maps can only be used as guidelines, but a detailed

soil survey can add significantly to the accuracy of image interpretations. Erosion-affected soil tones in areas adjacent to active channels proved beneficial in that the heightened contrast served to enhance resolution of vegetation-type boundaries. Hydrologic calculations were done based on valley cross-sections surveyed at two-to-three mile intervals. The historic data input into the system of floodplain delineation is dependent on the location of high-water marks and on obtaining a record of the amount of rainfall which resulted in the high-water mark. ELECTRONIC WATER LEVEL INDICATOR,
Universal Oil Products Co., Des Plaines, Ill. (assignee).
R. S. Markfelt.
U. S. Patent No 3,909,948, 3 p, 6 fig, 10 ref; Official Gazette of the United States Patent Office, Vol 939, No 1, p 46, October 7, 1975.

Descriptors: *Patents, *Water levels, *Water wells, *Measurement, Highwater mark, Electronic equipment, Instrumentation.
Identifiers: *Water level indicators.

A lightweight, portable electronic water level indicator utilizes a probe with vertically spaced contacts attached to a 2 conductor light gauge cable. The cable is wrapped around a flanged storage hub which has winding handles on each side. A simple electronic circuit is switched on by the presence of water between the probe contacts to control a signal device such as a light bulb. The circuitry, the signal device such as a light bulb. The circuitry, the signal device and the two AA size batteries that provide the power are all carried within the relatively small diameter hub. In use, the cable is unwound into a water well until the light goes on. One of the footage markers located at spaced intervals along the cable can then be observed to determine the depth location of the water in the well. (Sinha-OEIS)

An evaluation was conducted in the Atchafalaya River basin of South Central Louisiana, a humid area of heavily forested swamps with a large volume of flow mostly from a diversion of the lower Mississippi River. Techniques to obtain enlarged imagery from computer compatible tapes of ERTS data without photographic enlargement were explained and illustrated. Techniques of extraction of environmental information from single bands and multiband pattern recognition procedures were explained and evaluated. A comparison of pattern recognition classifications of the Atchafalaya basin by aircraft multispectral scanner and ERTS MSS data was made. Data for the comparison were gathered within three weeks of each other in the winter of 1973. Scorecards of the accuracy of the classifications were presented. Recommendations were made concerning the utilization of each sensor platform to perform specific tasks of wetlands characterization. (See also W76-02026) (Sims-ISWS)

Identifiers: *ERTS.

Forestry, geology, and water resource applications were the focus of a study, involving the use of computer-implemented pattern-recognition techniques to analyze ERTS-1 data. Several analysis capabilities have been developed during the ERTS-1 investigations. A procedure to rotate, deskew, and geometrically scale the MSS data resulted in 1:24,000 scale printouts that can be directly overlayed on 7 1/2 minute U.S.G.S. topographic maps. Several scales of computer-enhanced 'false color-infrared' composites of MSS data could be obtained from a digital display unit, and emphasized the tremendous detail present in the ERTS-1 data. A grid could also be superimposed on the displayed data to aid in specifying areas of interest, such as avalanche tracks or areas of burned-over timberland. Temporal overlays of six sets of data allowed both qualitative and quantitative analysis of changes in the areal extent of the snowpack. Computer-aided analysis of the data allowed one to obtain both cover-type maps and tables showing acreage of the various cover types, even for areas having irregular boundaries, such as individual watersheds. Identifiers: *ERTS, Data displays, Dimensionality reduction, Principal components analysis, Multispectral sensor data.

Standard NASA color composites combine the most relevant 3 bands from the 4 MSS bands available. An alternate approach is to extract the principal components of the data by a linear transformation of the 4 bands. This approach leads to a low dimensionality representation of ERTS-1 data with the least degradation, in the mean square sense, of the radiometric accuracy. The technique has been applied with success to ERTS-1 MSS data for several geographic areas in California. For all examples considered, the mean square representation error was less than one percent. By combining this dimensionality reduction with our

previous results on image enhancement for visual display, color composites were obtained which contained and displayed most of the information provided by the ERTS-1 sensors. (See also W76-02026) (Sims-ISWS)

In: Third Earth Resources Technology Satellite-1 Symposium, Volume 1: Technical Presentations, Section B. NASA SP-351, Proceedings of Symposium held December 10-14, 1973, Washington, D.C., ; 1719-1724, 1974. 4 fig.

Descriptors: *Satellites(Artificial), *Remote sensing, *Analytical techniques, Aerial photography, Data processing, Field crops, Wheat, Mapping, Computers.
Identifiers: *ERTS, Image transformations, Data displays, Geometric corrections.

During the development of a project to estimate wheat production, it became necessary to pull data, corresponding to particular fields in a test site, off an ERTS computer-compatible tape. Aerial photographs and topographic maps were on hand for the test site. A method was devised, using an affine transformation, to relate the aerial photographs or topographic maps to the tapes. One can thereby access data on the tape corresponding to regions covered by only a few pixels. The theory can be used for the registration of two tapes for the same area and for 'geometric correction' of images. (See also W76-02026) (Sims-ISWS)

Identifiers: *ERTS, Data displays.

An Electronic Satellite Image Analysis Console (ESIAC) has been developed for visual analysis and objective measurement of Earth Resources Imagery. The system is being employed to process imagery for use by USGS investigators in several different disciplines studying dynamic hydrologic conditions. The ESIAC provides facilities for storing registered image sequences in a magnetic video disc memory for subsequent recall, enhancement, and animated display in monochrome or color. The unique feature of the system is the capability to time-lapse the ERTS imagery and/or analytic displays of the imagery. Data products have included quantitative measurements of distances and areas, brightness profiles, and movie loops of selected themes. The applications of these data products were identified and include such diverse problem areas as measurement of snowfield extent, sediment plumes from estuary discharge, playa inventory, and phreatophyte and other vegetation changes. A comparative ranking of the electronic system in terms of accuracy, cost effectiveness, and data output showed it to be a viable means of data analysis. (See also W76-02026) (Sims-ISWS)

Conventional automatic data processing and information extraction techniques fall short of providing the information required by the user in some applications. For those cases, advanced techniques are needed to permit the extraction of the necessary information. Advanced techniques that have been developed were described, examples of their application to ERTS-1 MSS data were provided. The techniques described were designed to help overcome problems in location, mensuration, and classification accuracies which result from geometric distortions of the ERTS MSS data, the relatively coarse resolution of the sensor, and variations in atmospheric state over the region to be surveyed. It was shown that each of these factors can seriously degrade the ability to extract necessary information. Further, it was shown that advanced techniques can alleviate the effects of these factors.(See also W76-02026) (Sims-ISWS)

INTERPRETATION OF ERTS-1 IMAGERY AIDED BY PHOTOGRAPHIC ENHANCEMENT,
Canadian Forestry Service, Ottawa, (Ontario).
U. Nielsen.
In: Third Earth Resources Technology Satellite-1 Symposium, Volume 1: Technical Presentations, Section B. NASA SP-351, Proceedings of Symposium held December 10-14, 1973, Washington, D.C., p 1773-1786, 1974. 11 fig.

Descriptors: *Satellites(Artificial), *Remote sensing, *Analytical techniques, *Data processing, Photography, Surface waters, Rivers, Lakes, Forests, Data storage and retrieval.
Identifiers: *ERTS, Photographic enhancement.

Agfacontour film can be used to produce relatively economical enhancements of density differences recorded on film. Image interpreters often ask whether enhancement really increases the information content of the original images. Examples of ERTS-1 imagery enhancements show that it is possible to separate density levels which are not discernible by the human eye. It is stressed that these techniques do not replace the photo interpreter, but rather they aid him in the interpretation process. Subtle density variations are made to stand out and an objective classification of the densities forming the image is produced. (See also W76-02026) (Sims-ISWS)

tifiers: *ERTS, *Interpolation techniques, ge processing, Cubic convolution.

ew of almost any uncorrected photograph con- ted from ERTS MSS data provides a striking mple of a small section of the earth as seen space. Such images, beautiful as they are to eye, however, contain errors that limit their ulness where mensuration, precise location or temporal registration are required. The ission here was limited to processes by which of data samples collected on a geometrically rted grid can be converted to samples on a rent precisely specified grid. The resampling niques evaluated have included nearest hbor, bilinear, cubic convolution, and various cated versions of sinc (x). The conclusion was cubic convolution yields substantially higher ity output data for scenes typically encoun- d and can, in some instances, substantially nce ability to abstract information. binations of data from the four ERTS bands color images are usually made by selecting bands and displaying each in a different pri- color (red, green, and blue). Because the from the different bands are correlated, there is a tendency for the derived pictures to occupy only a small portion of the available color space. In the most common combination, MSS bands 1 and 2, which are highly correlated, are displayed as blue and green respectively, and band 3 as red. This results in a picture which for most regions might as well have been printed in red and blue-green. In the technique presented, colors were not derived from single bands, but rather from independent linear combinations of the bands. Using a simple model of the processing done by the visual system, three informationally independent linear combinations of the four ERTS bands were mapped onto the three visual color dimensions of brightness, redness-greenness and blueness-yellowness. The technique permitted user-specific transformations which enhance particular features, but this is not usually needed, since a single transformation provided which conveys much of the information implicit in the ERTS data. APPLICATION OF ERTS DATA TO RESOURCE SURVEYS OF ALASKA,
Alaska Univ. College.
A. E. Belon, and J. M. Miller.
In: Third Earth Resources Technology Satellite-1 Symposium, Volume 1: Technical Presentations, Section B. NASA SP-351, Proceedings of Symposium held December 10-14, 1973, Washington, D.C., p 1899-1907, 1974.

Descriptors: *Satellites(Artificial), *Remote sensing, Facilities, *Alaska, *Analytical techniques, Research facilities, Digital computers, Data processing, Surveys, Resources, Environment, Vegetation, Forestry, Sea ice, Snow, Pollutants, Water pollution.
Identifiers: *ERTS, Image processing.

ERTS data, with its demonstrated capability for economical surveys of large areas, affords a unique opportunity to perform urgently needed resource surveys and land-use planning at a critical juncture in the history of Alaska's social and economic development. A facility for retrieval, processing, and interpreting of ERTS data and aircraft remote sensing data has been established at the University of Alaska. This facility is widely utilized by twelve University ERTS projects and many agencies, public and private, to produce the needed environmental surveys in strategic regions of Alaska. The available facilities for photographic, optical, and digital processing of ERTS data were described, along with the interpretive techniques which have been developed. Examples of the applications of these facilities and techniques were given for three environmental disciplines: vegetation mapping for potential archeological sites; marine and sea-ice surveys on the Alaskan continental shelf for the determination of surface circulation and sedimentation patterns and their effects on navigation, pollution assessment, fisheries, location of harbors, and construction of offshore structures; and snow surveys for inventories of water resources and flood potential in Alaska watersheds. W76-02065

SCENE CORRECTION (PRECISION PROCESSING) OF ERTS SENSOR DATA USING DIGITAL IMAGE PROCESSING TECHNIQUES,
IBM Federal Systems Div., Gaithersburg, Md.
R. Berstein.
In: Third Earth Resources Technology Satellite-1 Symposium, Volume 1: Technical Presentations, Section B. NASA SP-351, Proceedings of Symposium held December 10-14, 1973, Washington, D.C., p 1909-1928, 1974. 18 fig, 6 tab, 6 ref.

Descriptors: *Satellites(Artificial), *Remote sensing, *Analytical techniques, *Data processing, Computers, Digital computers, Mapping, Facilities.
Identifiers: *ERTS, Image processing, Geometric corrections.

Techniques were developed, implemented, and evaluated to process ERTS Return Beam Vidicon (RBV) and Multispectral Scanner (MSS) sensor data using digital image processing techniques. The RBV radiometry was corrected to remove shading effects, and the MSS geometry and radiometry was corrected to remove internal and external radiometric and geometric errors. General purpose and special purpose computer configurations to process the data in a production mode were defined and their throughputs investigated. The results showed that geometric mapping accuracy of about one picture element RMS and two picture elements (maximum) can be achieved by the use of nine ground control points. Radiometric correction of MSS and RBV sensor data was performed to eliminate striping and shading effects to about one count accuracy. Image processing times on general purpose computers of the IBM 370/145 to 168 class were in the range of 29 to 3.2 minutes per MSS scene (4 bands). Photographic images of the fully corrected and annotated scenes were generated from the processed data and have demonstrated excellent quality and information extraction potential. SPECTRAL AND TEXTURAL PROCESSING OF ERTS IMAGERY,
Kansas Univ./Center for Research, Inc., Lawrence.
R. M. Haralick, and R. Bosley.
In: Third Earth Resources Technology Satellite-1 Symposium, Volume 1: Technical Presentations, Section B. NASA SP-351, Proceedings of Symposium held December 10-14, 1973, Washington, D.C., p 1929-1969, 1974. 6 fig, 10 tab, 32 ref, 2 append.

Descriptors: *Satellites(Artificial), *Remote sensing, *Data processing, *Analytical techniques, Land use, Classification, Mathematics, Computers, Digital computers, Analysis.
Identifiers: *ERTS, Image processing, Textural processing.

A procedure was developed to simultaneously extract textural features from all bands of ERTS multi-spectral scanner imagery for automatic analysis. Multi-images lead to excessively large grey tone N-tuple co-occurrence matrices; therefore, neighboring grey tone N-tuple differences were measured and an ellipsoidally symmetric functional form was assumed for the co-occurrence distribution of multi-image greytone N-tuple difference. On the basis of past data the ellipsoidally symmetric approximation was shown to be reasonable. Initial evaluation of the procedure was encouraging. (See also W76-02026) (Sims-ISWS)

DIGITAL IMAGE ENHANCEMENT TECHNIQUES USED IN SOME ERTS APPLICATION PROBLEMS,
Jet Propulsion Lab., Pasadena, Calif.
A. F. H. Goetz, and F. C. Billingsley.
In: Third Earth Resources Technology Satellite-1 Symposium, Volume 1: Technical Presentations, Section B NASA SP-351, Proceedings of Symposium held December 10-14, 1973, Washington, D.C., p 1971-1992, 1974. 9 fig, 12 ref.

Descriptors: *Satellites(Artificial), *Remote sensing, *Data processing, *Analytical techniques, Analysis, Digital computers, Geology, Land use, Oceanography.
Identifiers: *ERTS, Image processing, Image enhancement, Contrast improvement.

Enhancement and classification are not competing methods for machine image analysis. Enhanced images can be used alone or as inputs to classifica-

LIBRARY U. OF I. URBANA-CHAMPAIGN

tion routines. However, in some problems the spatial relationships are equal in importance to the classification results and enhancements can be designed to provide both types of information in one image. Enhancements discussed include contrast stretching, multiratio color displays, Fourier plane operations to remove striping and boosting modulation transfer function (MTF) response to enhance high spatial frequency content. The use of each technique in a specific application in the fields of geology, geomorphology and oceanography was demonstrated. (See also W76-02026) (Sims-ISWS)

QUALITY OF SURFACE WATERS OF THE UNITED STATES, 1970: PART 3. OHIO RIVER BASIN.
Geological Survey, Reston, Va.
Available from Supt. of Documents, GPO, Wash, D.C. 20402, price $3.90. Water-Supply Paper 2153, 1975. 444 p, 1 fig, 41 ref.

Descriptors: *Water quality, *Surface water, *Sediment transport, *Water temperature, *Ohio River, River basins, Lakes, Basic data collections, Alabama, Georgia, Indiana, Kentucky, Maryland, New York, North Carolina, Ohio, Pennsylvania, Tennessee, Virginia, West Virginia, Chemical analysis, Physical properties, Particle size, Inorganic compounds, Biological properties, Streamflow.
Identifiers: *Ohio River basin.

During the water year ending September 30, 1970, the Geological Survey maintained 181 stations on 104 streams in the Ohio River basin for the study of chemical and physical characteristics of surface water. Samples were collected daily and monthly at 95 of these locations for chemical-quality studies. Samples also were collected less frequently at many other points. Water temperatures were measured continuously at 80 and daily at 63 stations. Daily water temperatures were measured at most of the stations at the time samples were collected for chemical quality or sediment content. So far as practicable, the water temperatures were taken at about the same time each day. Quantities of suspended sediment are reported for 22 stations. Sediment samples were collected one or more times daily at most stations, depending on the rate of flow and changes in stage of the stream. Particle-size distributions of sediments were determined at 16 stations. The stream discharge reported for a composite sample is usually the average of daily mean discharges for the composite period. The discharges reported in the tables of single analyses are either daily mean discharges or discharges obtained at the time samples were collected and computed from a stage-discharge relation or from a discharge measurement. (Woodard-USGS)

SURFACE WATER SUPPLY OF THE UNITED STATES, 1966-70: PART 8. WESTERN GULF OF MEXICO BASINS--VOLUME 1. BASINS FROM MERMENTAU RIVER TO COLORADO RIVER.
Geological Survey, Reston, Va.
Available from Supt. of Doc, U.S. Govt. Printing Off, Washington, D.C. Water-Supply Paper 2122, 1975, 1144 p, 1 fig.

Descriptors: *Basic data collections, *Surface waters, *Streamflow, *Lakes, River basins, Gulf of Mexico, Louisiana, New Mexico, Texas, Runoff, Discharge(Water), Gaging stations, Flow measurement, Flow rates, Average flow, Hydrologic data, Lakes, Reservoirs.
Identifiers: *Western Gulf of Mexico basins, Maximum discharges, Minimum discharges.

This volume is one of a series of 37 reports presenting records of stage and discharge of streams, and of stage and content of lakes and reservoirs in the United States during the 1966-70 water years; it contains the records for gaging stations and partial-record stations in the Western Gulf of Mexico basins, Mermentau River to Colorado River. This report is one of the second series of water-supply papers to be published on a 5-year basis. The first series covered the 5-year period October 1, 1960, to September 30, 1965. This series covers the period October 1, 1965, to September 30, 1970. The daily table for stream-gaging stations gives the mean discharge for each day and is followed by monthly and yearly summaries of total, average, maximum, and minimum discharges. (Woodard-USGS)
W76-02133

MAP SHOWING THICKNESS OF THE PERMIAN (GUADALUPIAN) CAPTAIN AQUIFER, SOUTHEAST NEW MEXICO AND WEST TEXAS,
Geological Survey, Albuquerque, N. Mex.
W. L. Hiss.
Open-file map, June 1975, 1 sheet, 16 ref.

Descriptors: *Water wells, *Aquifers, *Maps, *New Mexico, *Texas, Groundwater resources, Aquifer characteristics, Petrology, Hydrogeology, Wells, Sites, Mapping, Geomorphology, Oil industry.
Identifiers: *Captain aquifer(N Mex-West Texas).

The Captain aquifer is an important source of the groundwater used for municipal, industrial, and agricultural purposes in the vicinity of Carlsbad, N. Mex. In addition, water pumped from this aquifer in southern Lea County, New Mexico, and Winkler and Ward Counties, Texas, is injected into other reservoirs by oil companies to increase the recovery of petroleum from partially depleted oilfields. A knowledge of the dimensions of the Captain aquifer in southeastern New Mexico and western Texas will be useful in programs designed to manage this important resource. This map, depicting the position and thickness of the Captain aquifer, will also be helpful to petroleum companies who may wish to control lost circulation while penetrating this porous and permeable unit as they explore for oil and gas in underlying strata. The aquifer is generally composed of relatively 'clean' carbonate rock, especially near the fore-reef edge. The locations of nearly 400 wells that have been drilled through the Captain aquifer within the project area, along with corresponding thickness of the aquifer penetrated in each well, are plotted. REDWOOD NATIONAL PARK STUDIES RELEASE NUMBER 1: REDWOOD C HUMBOLDT COUNTY, CALIFORNIA TEMBER 1, 1973-APRIL 10, 1974,
Geological Survey, Menlo Park, Calif.
R. T. Iwatsubo, K. M. Nolan, D. R. Harden G. D. Glysson.
Open-file report, October 1975. 123 p, 4 fig 48 ref.

Descriptors: *Hydrologic data, *Surface *Water quality, *National parks, *Ca Ecosystems, Streamflow, Sediment tr Sedimentation, Water temperature, Envir tal effects, Land use, Chemical analysis, flow, Channel morphology.
Identifiers: Redwood National Park(Calif boldt County(Calif).

An interdisciplinary study has been under Redwood National Park, Calif., to descri of the ecosystems and recent changes in th sity of erosion and sedimentation, processes that may alter the natural eco and assess the impact of recent road cons and timber harvest. This report is the first ries that will present data collected in thi Stream-discharge and water-quality data w lected at 27 stations in the Redwood drainage basin. Measurements included lowing variables: Stream stage and dischar bidity; sediment; onsite water-quality det tions of temperature, pH, total alkalinity, conductance, and dissolved-oxygen con tion; chemical analysis of water samples fo dissolved solids, selected trace elements, and phosphorus, and organic carbon; c bacteria; benthic invertebrates; and seston tional data include changes in geometry stream-channel cross sections along Re Creek, distribution of erosional landform drainage areas of six tributaries to Re Creek, and quantity and chemical compos rain. (Woodard-USGS)
W76-02144

HYDROLOGIC DATA FOR COW B BRAZOS RIVER BASIN, TEXAS, 1973,
Geological Survey, Austin, Tex.
J. K. VanZandt.
Open-file report, May 1975. 74 p, 3 fig, 3 tab

Descriptors: *Hydrologic data, watersheds, *Texas, *Streamflow, *Rain noff relationships, Storms, Flood plains, protection, Runoff, Flood control, Water s Hydrologic budget.
Identifiers: *Cow Bayou(Tex), Mooreville(

This report, which is the thriteenth in a se basic-data reports published annually for th Bayou study area, contains the rainfall, and storage data collected during the 197 year for the 85.0 sq mi area above the strea ing station Cow Bayou at Mooreville, Texa 26 flood-retarding structures in the stud have a combined capacity of 15,510 acre-ft flood-spillway crests and regulate floodflow

area of 42.7 sq mi, or approximately 50 percent
he drainage area. The physical data at each of
26 floodwater-retarding structures above the
am-gaging station are summarized. The
ghted-mean rainfall during the 1973 water year
41.28 in., or 124 percent of the 15-year (1959-
average of 33.24 in. Monthly rainfall ranged
n 0.10 in. in August to 6.04 in. in September.
rly mean discharge at the stream-gaging sta-
was 48.9 cfs. compared with the 15-year
rage of 36.1 cfs. Annual runoff at the stream-
ing station was 35.410 acre-ft, or 7.81 in. Com-
ations for three storm periods include detailed
e breakdown of rainfall and discharge. Hydro-
phs and mass curves are drawn for illustrations.
storms selected occurred March 24, 1973,
y 25, 1973, and June 3, 1973. (Woodard-USGS)

er interfaces, National parks.
ntifiers: *Cape Hatteras National
shore(NC).

fresh groundwater reservoir described in this
eet atlas of the Cape Hatteras National
shore, N. C., consists of a water-table aquifer
ch extends from the land surface to the first
fining beds of silt and clay, and confined or
i-confined aquifers beneath and between the
and clay beds. The water-table aquifer ranges
hickness from 10 to 50 feet and averages about
feet. The altitude of the water table averages 3
above mean sea level along the narrow parts
he seashore, and is as high as 10 feet at Cape
teras. Rainfall is responsible for the occur-
ce and maintenance of the fresh groundwater
rvoir, and most rain water enters directly into
water-table aquifer with little or no surface ru-
f. The presence of salty water at relatively shal-
depths is a factor affecting the withdrawal of
h groundwater, because any lowering of the
d in the aquifer, either naturally or by pump-
produces a rise in the interface. Therefore,
wdown is the key to the recovery of fresh
er in the seashore, and fresh-water recovery
be most efficient when drawdown is minimal.
method for accomplishing this is to spread
drawals over a larger area with a horizontal
instead of concentrating the effect at a point
a vertical well. (Woodard-USGS)

**ODS IN THE FAJARDO-LUQUILLO AREA,
RTHEASTERN PUERTO RICO,**

logical Survey of Puerto Rico, San Juan.
J. Haire.

For sale by USGS, Reston, Va 22092, price $1.00 per set. Hydrologic Investigations Atlas HA-545, 1975. 1 sheet, 6 fig, 3 tab, 3 ref.

Descriptors: *Floods, *Flood profiles, *Flood plains, *Flood data, *Puerto Rico, Hydrologic data, Flood frequency, *Maps, Hydrographs, Planning, Land use.
Identifiers: *Fajardo-Luquillo area(PR).

Factual and interpretive information are provided for major floods in the Fajardo-Luquillo area, Puerto Rico. The information is a technical basis on which the planner, engineer, administrator, or other interested persons can make decisions related to land use and development compatible with the degree of flood risk. Data include tabulations of flood discharge and flood stage, flood profiles, and a map of the areas inundated by the floods of 1960 in the Rio Fajardo basin; the floods in 1970 in the Rio Sabana, Rio Pitahaya and Rio Juan Martin basins; and the flood of 1972 in the Rio Mameyes basin. The areas of inundation are specifically for conditions that existed at the time of flood-frequency data is presented for selected sites. (Woodard-USGS)

GROUND-WATER FAVORABILITY AND SURFICIAL GEOLOGY OF THE MACHIAS-LUBEC AREA, WASHINGTON COUNTY, MAINE,
Geological Survey, Augusta, Maine.
G. C. Prescott, Jr.
For sale by USGS, Reston, Va 22092, price $1.00. Hydrologic Investigations Atlas HA-535, 1974. 1 sheet, 13 ref.

Descriptors: *Groundwater resources, *Aquifer characteristics, *Water quality, *Water wells, *Maine, Water yield, Water level fluctuations, Hydrogeology, Surface-groundwater relationships, *Maps.
Identifiers: *Washington County(Maine), *Machias-Lubec area(Maine).

This report of the Machias-Lubec area is one of a series describing the geologic and hydrologic conditions governing the occurrence of groundwater in Maine. The information is intended for those doing resource planning, or for those wishing to develop water supplies, particularly supplies large enough for public, industrial, or commercial use, from groundwater sources. The Machias-Lubec area includes about 330 sq mi in Washington County on the eastern border of Maine. Included are parts or all of the following towns or townships: Cutler, Dennysville, East Machias, Eastport, Edmunds, Lubec, Machias, Machiasport, Marion, Marshfield, Pembroke, Perry, Roque Bluffs, T. 18 E.D., Trescott, Whiting, and Whitneyville. The depth of 218 bedrock wells ranged from 20 to 855 feet. The average depth was 168 feet, and the median depth was 140 feet. Thirteen percent of the bedrock wells had a yield exceeding 15 gpm. Most of these were in the 51-to 100-foot depth range. The quality of the groundwater is generally good for most purposes. It is normally low in dissolved solids and soft. (Woodard-USGS)

LANDSAT, A SATELLITE SURFACE WATER DIVINING ROD,
National Aeronautics and Space Administration, Houston, Tex. Lyndon B. Johnson Space Center.
K. J. Hancock, and E. H. Schlosser.
In: Papers from the Fall Convention, American Society of Photogrammetry, October 26-31, 1975, Falls Church, Virginia, p 375-380, (1975).

Descriptors: *Remote sensing, *Surface waters, *Hydrologic data, *Computer programs, *Mapping, Computers, Lakes, Data processing, Instrumentation, Data collections, Water, Hydrology, Surveys, Maps, Bodies of water.
Identifiers: LANDSAT, DAM(Detection and Mapping) package.

The DAM (Detection and Mapping) package was developed to provide accurate, up-to-date, economical and properly formatted maps of surface water using LANDSAT earth resources satellite digital data. The DAM package is an integrated system of computer programs, step-by-step manual procedures, and special graphic devices. The total procedure consists of acquiring the data, establishing the control network, specifying the map characteristics, and generating the maps. Using published LANDSAT catalogs, the user selects relatively cloud-free scenes over the areas of interest, and then orders computer tapes and positive transparencies, and appropriate maps. In the control network establishment step, the user selects 6 to 18 well-defined control points on a LANDSAT scene for which a computer program corrects the MSS coordinates. Map characteristics can then be specified and the computer programs perform the following operations: (1) adjust network and determine registration coefficients; (2) classify all pixels as water or non-water; (3) join classified data derived from separate tapes; (4) check all specifications and flag errors; and (5) register, format, annotate and output all maps. (Robinett-Arizona)

FLOOD PLAIN MAPPING: PHOTOGRAMMETRIC DATA FOR HYDROLOGY,
Hurd (Mark) Aerial Surveys, Inc., Minneapolis, Minn.
J. T. Dozzi.
In: Papers from the Fall Convention, American Society of Photogrammetry, October 26-31, 1975, Falls Church, Virginia, p 633-639, (1975), 1 tab.

Descriptors: *Flood plains, *Photogrammetry, *Mapping, *Aerial photography, *Flood profiles, Cross-sections, Maps, Photography, Surveys, Topography, Flood control, Flood protection, Hydrology, Flood plain zoning, Rivers, Streams, Floods, Cameras, Remote sensing, Terrain analysis, Elevation, Computer programs, Indirect flood measurement.
Identifiers: *Flood plain mapping, Base maps, Mosaics, Orthophotos, Stereo photography.

Because of the cost and time required for flood plain mapping using conventional techniques, it was envisioned that the stereo plotter could be utilized to develop data in a simple useable format for the hydrologist. Work was conducted with State-Federal agencies and consulting hydrologists to develop and utilize mapping techniques providing elevation and base data necessary for the detailed flood plain studies. The method has been to photogrametrically digitize overbank valley cross sections on a data card format ready for the hydrologist's step-backwater computer program. Base maps are prepared simultaneously in the form of line drawings, mosaics, or orthophotos. After the hydrologist has determined the elevations for flood water profiles, the stereo models can be reset and the flooded area delineated by a sloping elevation line which represents where high-water intersects with high ground. Since 1968 over 30 such flood plain mapping projects have been completed. (Robinett-Arizona)

Solid-waste deposits are adversely affecting the environment in the Puget Sound basin, Washington, especially water resources at and near disposal sites. An adequate evaluation of the environmental impact of solid-waste disposal in the basin requires reliable data on waste deposits and their environmental setting. As an acid to such evaluation, this report (1) presents an inventory of currently active, many former (inactive), and a few planned solid-waste disposal sites; (2) provides information about the active sites in relation to some features of the local environment; and (3) discusses relationships between solid-waste disposal and water quality in a rapidly urbanizing part of the Puget Sound region. Also presented is a graphic portrayal of some undesirable results of solid-waste disposal in areas of moderately permeable rock materials. (Woodard-USGS)

LIMNOLOGICAL DATA REPORT FOR MAINE DEPARTMENT OF ENVIRONMENTAL PROTECTION--U.S. GEOLOGICAL SURVEY COOPERATIVE LAKE STUDIES PROJECT,
Geological Survey, Augusta, Maine.
D. J. Cowing, and M. Scott.
Open-file report, October 1975. 135 p, 1 fig, 10 ref.

Descriptors: *Limnology, *Lakes, *Water quality, *Epilimnion, *Maine, Lake morphometry, Data collections, Physical properties, Chemical properties, Biological properties, Chemical analysis, Sampling, Pollutant identification.

The report contains physical, chemical, and biological information collected on 43 Maine lakes during the 1974 calendar year. Methods for the collection and analysis of the hydrologic data are outlined. Physical characteristics listed include drainage area, surface area, surface elevation, volume, maximum depth, mean depth, epilimnion depth, epilimnion volume, and length of shoreline. Water-quality analyses are listed for up to 30 parameters on the lake sample sites and 3 parameters on flowing tributaries. Biological analyses include phytoplankton data for 35 of the study lakes and bacterial data on selected tributaries. (Woodard-USGS)

ntifiers: Provo(Utah), FORTRAN IV computer gram.

o FORTRAN IV computer programs were eloped to facilitate the reduction of eorologic data from irrigated and nonirrigated s at Provo, Utah. The first program compiles tabulates daily, monthly, and yearly summa- of precipitation as rain and/or snow, snowfall, l snow cover, soil moisture, dew, relative hu-ity, potential evaporation, cloud cover, and d. Temperature is tabulated for a standard ther shelter, on bare ground, at the soil surface er grass cover, and 5 cm beneath the soil sur-e under grass cover. The second program ena-s complete computerized (Calcomp) construc-, labeling, and graphing of 10 different eorologic measurements and 3 calculated com-isons of temperature means. Mean tempera-es for 5 cm beneath the soil surface and at the surface under grass cover, and on a bare soil face were consistently lower on the irrigated compared to the nonirrigated area. Soil isture was higher (22.7 percent moisture) on the gated area compared to the nonirrigated (9.4 cent moisture). The other meteorologic data, in ition to temperature and soil moisture, phasize the marked beneficial impact of irriga-in creating favorable microenvironments for ng organisms. (Robinett-Arizona)

ntifiers: Drainage stacks, Pipe sizes.

adequate knowledge of the hydraulics and umatics of building drainage systems is neces-y for the computation of the minimum sizes of es that can be used satisfactorily in the various ts. Experimental studies of the hydraulics and umatics of plumbing systems conducted at the tional Bureau of Standards and other laborato- since 1921 on the capacities of stacks and izontal branches are discussed. The application of research results to the computation of loads for drainage and vent stacks is illustrated. Some of the loadings found in current tables of plumbing codes are compared with loadings computed in this paper. Conclusions are presented in the following areas: intererence of flows at junctions of drainage stack and horizontal branches; flow capacities of drainage stacks; air flow in drainage systems; loading tables; distribution of air and water in cross sections of drainage stacks; velocity distribution of water in cross sections of drainage stacks; and, pneumatic pressures within drainage stacks. Additional research is needed on design flow and flow capacity problems. (Orr-FIRL)

INVESTIGATION OF THE HYDRAULICS OF HORIZONTAL DRAINS IN PLUMBING SYSTEMS,
National Bureau of Standards, Washington, D.C.
R. S. Wyly.
Available from the National Technical Information Service, Springfield, Va 22161 as COM-75-10046, $4.00 in paper copy, $2.25 in microfiche. National Bureau of Standards MN 86, December 18, 1964. 38 p, 26 fig, 23 tab, 18 ref, 4 append.

Descriptors: *Sewers, *Plumbing, *Hydraulics, Hydraulic engineering, Hydraulic design, Pipes, Drains, Hydraulic gradient, Flow.

An investigation of the hydraulics of flow in experimental equipment which simulated nominally horizontal simple and branching drains of plumbing systems is discussed. It is necessary to know the hydraulics of these drains when building sanitary drainage systems in order to rationally determine the minimum pipe sizes for these systems. Information concerning the hydraulics of sanitary building drains and building sewers as well as some of the factors which affect their hydraulic capacities are reported. Conclusions are presented for the following areas: estimating hydraulic capacity; design of plumbing systems with minimum venting; utilization of field data and of data on surge attenuation; effect of surge-duration time, drain slope, and other factors on hydraulic capacity; surge-flow capacities of simple drains; steady flow capacities of compound drains; capacities for surge flow superimposed on steady flow; and, computation of allowable fixture-unit loads. There is a need for further research in this area, especially in relation to hydraulic performance of drain systems as affected by steep slopes, drain storage volume, energy losses at stack bases, attenuation of water depths and discharge rates in long drains, and large drain diameters. The results of this investigation have important applications for the writing of plumbing codes and handbooks with respect to the optimum plumbing loads on building drains and building sewers. SURFACE ROUGHNESS EFFECTS ON THE MEAN FLOW PAST CIRCULAR CYLINDERS,
Iowa Univ., Iowa City. Inst. of Hydraulic Research.
O. Guven, V. C. Patel, and C. Farell.
IIHR Report No 175, May 1975, 184 p, 78 fig, 30 tab, 40 ref, 2 append. NSF GK-35795.

Descriptors: *Roughness(Hydraulic), *Fluid mechanics, *Drag, *Pressure drag, *Laboratory tests, *Flow around objects, Boundary layers, Reynolds number, Cooling towers, Analysis, Design data, Flow separation, Turbulence, Velocity.
Identifiers: *Drag coefficients, Aerodynamics, Pressure distribution, Pressure coefficients, Wind tunnels.

The effects of surface roughness on the mean pressure distribution and the boundary-layer development on a circular cylinder in a uniform stream were investigated experimentally. Sandpaper roughness and rectangular meridional ribs were tested over a Reynolds-number range from 70,000 to 550,000. The effects of rib roughness were similar to those to distributed roughness. In the case of large ribs, strong local effects were observed. Results were examined in the light of boundary-layer theory and previous data, and were supported by this analysis. Special attention was given to variations in the drag coefficient and pressure-distribution parameters with surface roughness at large Reynolds numbers. When the Reynolds number exceeded a certain value, determined by the roughness, the pressure distribution became dependent only on the roughness geometry. Substantial reductions in the magnitude of the minimum pressure coefficient on large cylindrical structures, such as hyperbolic cooling towers, were shown to be obtainable by roughening the external surface with meridional ribs. The results also indicated that pressure distributions on prototypes could be reproduced on scaled models by employing a proper combination of Reynolds number and surface roughness. Experiments were also performed with a rough-walled cylinder and movable side-walls to study the influence of wind-tunnel blockage on the pressure distribution. The results, described in an appendix, verified a blockage-correction procedure proposed previously. (Adams-ISWS)

AN EMPIRICAL DESCRIPTION OF WALL JET VELOCITY PROFILES,
Indian Inst. of Tech., Madras (India), Dept. of Applied Mechanics.
N. V. C. Swamy, B. H. L. Gowda, and N. Chandrashekhar.
Indian Journal of Technology, Vol 13, No 3, p 103-106, March 1975, 6 fig, 1 tab, 10 ref.

Descriptors: *Jets, *Velocity, *Friction, *Turbulent flow, Dimensions, Boundary layers, Shear stress, Viscosity, Equations.
Identifiers: *Wall jets, *Empirical relation, Two-dimensional, Radial, Three-dimensional, Skin friction.

An empirical expression was proposed to describe the velocity profiles of two-dimensional, radial, and three-dimensional wall jets. Comparison with available experimental data showed that the empirical expression represented the velocity profile quite well for the three types. The values of skin friction obtained using the proposed function at points very close to the wall were also discussed. (Bhowmik-ISWS)

TOPOLOGICALLY RANDOM CHANNEL NETWORKS IN THE PRESENCE OF ENVIRONMENTAL CONTROLS,
New South Wales Univ., Kensington (Australia). School of Geography.
A. D. Abrahams.

LIBRARY U. OF I. URBANA CHAMPAIGN

Geological Society of America Bulletin, Vol 86, No 10, p 1459-1462, October 1975, 1 fig, 5 tab, 23 ref.

Descriptors: *Channel morphology, *Channel flow, *Stochastic processes, *Geomorphology, *Environmental control, Statistical methods, Microclimatology, Geologic control, Pleistocene epoch, Streams, Networks, Australia.
Identifiers: *Channel networks, Topology, Stream numbers, *New South Wales(Australia).

In areas where environmental controls have a preferred orientation, certain topologically distinct channel networks may be promoted where networks of a given magnitude flow in one direction and inhibited where they flow in another; but these biases in network topology may compensate for one another so effectively that they do not give rise to identifiable systematic deviations from topological randomness. This theme was illustrated by analyses of magnitude-4 channel networks from three areas in southeastern Australia. Goodness-of-fit tests indicated that the exhaustive samples of networks from these areas could have been drawn from topologically random populations. However, similar tests applied to subsamples selected according to network flow direction revealed biases in network topology in two of the areas. These biases, which were apparently due to microclimatic controls, signified that, although the networks in each area may belong to a topologically random population, they are not composed of randomly merging stream channels. SEDIMENT TRANSPORT IN SMOOTH FIXED BED CHANNELS,
Newcastle upon Tyne Univ., (England). Dept. of Civil Engineering.
P. Novak, and C. Nalluri.
Journal of the Hydraulics Division, American Society of Civil Engineers, Vol 101, No HY9, Proceedings Paper 11556, p 1139-1154, September 1975. 10 fig, 17 ref, 2 append.

Descriptors: *Sediment transport, *Sediment load, *Hydraulics, *Tractive forces, *Open channel flow, Flumes, Conduits, Slopes, Laboratory tests, Sewers, Bed load, Analytical techniques, Sediments, Shear stress, Flow.
Identifiers: *Incipient motion, Critical velocity.

Incipient motion of discrete particles resting on a fixed smooth channel bed and sediment transport as bed load were investigated in circular conduits and rectangular flumes with free surface flow. The investigations were carried out in a tilting flume and the flow patterns and sediment movement were observed in a glass section. Equations for the critical velocity and critical shear stress were derived. These equations enabled a comparison with criteria generally adopted for movable beds. A higher value of critical velocity or shear stress was indicated for a rectangular channel than for a channel with circular cross section. A dimensionless plot of critical velocity and flow depth was obtained, suggesting that a full correlation for incipient motion of sediment particles in any conveyance shape with a fixed smooth bed is valid. The engineering implications of these results were examined, with the conclusion that the critical velocities obtained were appreciably lower than those normally adopted, for example, in sewer design. (Singh-ISWS)

TURBULENT DENSE PLUMES IN A LAMINAR CROSS FLOW,
McGill Univ., Montreal (Quebec). Dept. of Civil Engineering and Applied Mechanics.
V. H. Chu.
Journal of Hydraulic Research, Vol 13, No 3, p 263-279, 1975. 6 fig, 1 tab, 14 ref.

Descriptors: *Jets, *Laminar flow, *Entrainment, *Circulation, *Model studies, Laboratory tests, Buoyancy, Vortices, Turbulence, Flow, Mixing, Drag, Velocity, Density
Identifiers: *Turbulent dense plumes, Mechanistic models.

Turbulent 'dense plumes' in a laminar cross flow were simulated in the laboratory by injecting saline solution vertically upward into an open channel flow. In the experiment, the large scale vortex-like circulation, responsible for turbulent entrainment of the cross flow into the plume, was observed to reverse after the plume reaches the peak and descends. The experiment was performed to verify an entrainment theory in the study of buoyant forced-plumes in cross flow. The theory, which involves only one unknown parameter--the entrainment coefficient, was based on a mechanistic model which describes the formation of the circulation of the vortex pair in the plume. In comparing the theory with the experiment, the entrainment coefficient for dense plume was found to be a constant, approximately equal to 0.5. The same constant was obtained for momentum jets and buoyant plumes. (Singh-ISWS)

A CONTRIBUTION TO THE STUDY OF VORTEX RIPPLES,
Cambridge Univ. (England). Dept. of Engineering.
J. F. A. Sleath.
Journal of Hydraulics Research, Vol 13, No 3, p 315-328, 1975, 4 fig, 13 ref.

Descriptors: *Waves(Water), *Vortices, *Numerical analysis, *Sediment transport, *Mixing, Wavelengths, Turbulence, Model studies, Analytical techniques, Hydraulics, Flow, Ripple marks, Laminar flow.
Identifiers: *Vortex ripples, Fluid drift.

The fluid velocities close to a two-dimensionally rough bed in oscillatory flow were solved by numerical solution of the equation of vorticity. It was observed that the fluid close to the bed drifts towards the crests, and it was suggested that this provides a mechanism for the formation of vortex ripples by water waves. On the assumption that the ripples which form correspond to maximum fluid drift towards the crest, a theoretical relationship was derived for ripple wavelength in terms of the flow parameters. This relationship showed quite good agreement with experimental results for ripples when sediment exchange between adjacent crests was small. The most notable omission from the theoretical model was the neglect of turbulence. The fact that the difference between the theoretical curve and the experimental results was small added weight to the suggestion that the flow continues to be dominated by the large-scale mixing by vortex formation and decay. (Singh-ISWS)

PUMPS AND VALVES FOR THE WATER INDUSTRY.
Water Services, Vol 79, No 954, p 333-334, August 1975, 1 fig.

Descriptors: *Pumps, *Sewerage, *Valves, Water treatment, Waste water treatment, Flow rates, Sewage treatment, Treatment facilities, Sealants.
Identifiers: Dry weather flow.

Several pumps and valves for sewerage and water treatment have been developed in Great Britain. A new Tuke and Bell, Rolls Rotary positive displacement crude sewage pump was designed to solve large flow problems at pump fed, small sewage treatment plants. Each pump is rated at the preferred 1.5 times dry weather flow; a duty assist pump can provide a back-up three times dry weather flow when required. In another case problem of controlling sewage flow to a tempo treatment system has been solved with close pled Freway vertical spindle pumps. These stract a proportion of crude sewage at the works in order to provide a constant BOD lo the temporary plant. Relief valves to ensure s against external hydraulic pressures particu from high water tables in treatment tanks pools, were also described. An 80 mm up pressure relief valve has also been patented, w has flexible sealing faces to maintain an effe seal in the presence of sand and silt. (Kra FIRL)

entifiers: Sewerage collection, San Diego(Calif).

o improve collection system for the city of San iego, it was necessary to add a second force ain. Because the new pipeline would travel two iles subaqueously along the floor of the San iego Bay, very stringent specifications for a leakoof sewer force main were required. A concrete d steel joint was developed of a design using ree 0-ring gaskets and both bell and spigot eleents at each end of each pipe section. The pipe itlf is made of a rod-wrapped steel cylinder and ge and is encased in a 13-inch wall of vertically st concrete. The configuration of a double mated int system with a single O-ring gasket around a eel spigot and two O-ring gaskets around a doued grooved concrete spigot provides a watergh seal, protecting the steel joint rings from the fects of salt water. A unique minus-pressure chnique is used to join the two pipe sections der water during installation. To place the peline in its location at San Diego Bay, material as dredged from the bay flood and released as itive backfill over the pipe; the trench created as graded for pipe installation, and the pipe was bmerged. When all three O-rings were in proper ntact, as determined with a gage, a vacuum line as applied between the bells to pull the joint into total, water-tight seal. An average of four 57-ton pe sections were installed per day. Internal testg of each pipe joint plus cleaning of the annular ace between O-ring gaskets were also perrmed. (Kramer-FIRL)

SEWER LINING--THE TORONTO TECHNIQUE,
Department of Public Works, Toronto (Ontario).
A. W. Pellegrino.
The American City and County, Vol 90, No 9, p 86-87, September 1975.

Descriptors: *Plastic pipes, *Repairing, *Sewers, *Equipment, Pipelines, Maintenance, Infiltration, Equipment, Cleaning, Canada.
Identifiers: *Reaming, *Television inspection, Toronto(Ont).

A technique has been developed for increasing flow capacity in deteriorating sewer lines by the insertion of high density polyethylene pipe. This rehabilitation technique was used by the city of Toronto and was found to increase sewer capacity, decrease costs, and avoid leaking and infiltration. Prior to relining, a study of site conditions was made to determine locations of all private drains connecting to the sewer. Closed circuit television was used both to inspect the system for cracks, protrusions, and obstructions, and to observe the action of the reaming operation. Reaming out obstructions was performed from one manhole to the next, a distance of 300 feet. Maintenance of the reaming equipment, including daily motor and bearing lubrication, was essential to the success of the procedure. After the reamer had been used, the entire length of the sewer was flushed out to remove debris. The actual insertion of the plastic liner involved positioning a continuous fused length of pipe on rollers with a vibrating nose cone attached to it. The linear was pulled into the old sewer by means of a winch truck positioned over a manhole about 500 feet away. Immediately after the plastic liner had been inserted, lateral cutting and grouting was carried out to connect all drains. Over a mile of these linings have been inserted in Toronto, with no failure and a properly functioning sewer system in all cases. (Kramer-FIRL)

NEW SEWER SURVEY TV CAMERAS.
Water, No 5, p 37, October 1975, 1 fig.

Descriptors: *Monitoring, *Sewers, Equipment, Control systems, Cameras, Remote sensing.
Identifiers: Television inspection.

A new sewer survey camera, manufactured by Seer TV Surveys Limited, Surrey, Great Britain, uses only a 12 volt supply to feed both the electronics and the remote control motors. These operate from a simple camera control unit established in the mobile survey unit. By eliminating the need to pass voltage signals through the camera cable, the camera is more suitable for gas and chemical lines where high powered lighting increases the risk of lamp explosion and ignition of flammable substances. A low light level camera system was also manufactured which can achieve remarkable results using only up to 10 watts of light. The lamp is mounted in a sealed flashproof and impact resistant capsule which is situated at the front of the camera casing. (Kramer-FIRL)

LASER TUNNELLING GUIDANCE SYSTEM.
Water, No 5, p 36, October 1975.

Descriptors: *Sewers, *Tunneling, *Lasers, *Construction, Monitoring, Equipment, Sensors, Tunnel construction, Remote sensing.
Identifiers: Light sensitivity.

A new laser guidance system was developed to improve accuracy in tunnelling. Marketed by Mini Tunnels International Surrey, Great Britain, the guidance system uses a light sensitive quadrant in a 150 mm diameter steel tube which replaces the normal target for the laser beam. The value of light upon each quadrant section serves a digital reader device fixed near the miner within the shield and gives a reading in millimeters of the shield deflection from datum. A repeater installed in the office is used to monitor the tunnel drive. A continuous gas sampling detector, also newly developed, performs routine gas detection in the tunnels and does not rely upon vulnerable portable equipment. This sensor runs from the tunnel lighting supply; two sensing tubes draw in samples from different points in the driving shield. In the event of dangerous gases reaching a predetermined threshold level, tunnel lights will flash a danger signal. (Kramer-FIRL)

PLASTIC MORTAR PIPE SOLVES JOINT PROBLEM,
C. A. Carlson.
Water and Sewage Works, Vol 122, No 9, p 84-85, September 1975.

Descriptors: *Sewers, *Pipelines, Plastic pipes, Construction materials, Recycling, Construction costs, Environmental effects, California.
Identifiers: Southern Laguana(Calif).

The Southern Laguana, California, Sanitary District has replaced a badly deteriorated 21-inch vitrified clay pipeline with a new 24-inch diameter reinforced plastic mortar pipe over a two mile area. As part of the sewer reconstruction project, the 21-inch clay pipe was crushed into aggregate-size particles inside the tunnel and was used as additional bedding for the replacement pipe. After a crusher had broken the old clay pipe and made new grade, new sections of ten-foot (24-inch diameter) Techite pipe were transported to the site; laser equipment was used for alignment. This disposal method, by reusing the old pipe, saved the district over $100,000 in construction costs. Because access to public and private beach areas was necessary for the project, public relations were very important. Except for temporary storage of pipe, construction equipment, and tools, the impact on the ecology of the beach area was minimal. (Kramer-FIRL)
W76-02178

HORSHAM TESTS COMPLETE.
Surveyor, Vol 146, No 4343, p 44, September 5, 1975.

Descriptors: *Laboratory tests, *Analytical techniques, Sewage treatment, Treatment facilities, Filtration, Screening, Pumps, Equipment, Model studies,
Identifiers: *Sumps.

Laboratory tests have been conducted on a model of the sump of the new Horsham sewage works. This test program was an integral part of Sigmund Pulsometer Projects' 420,000 contract to supply the pumps and ancillary equipment. New sewage works at Horsham are being built for the Southern Water Authority; the existing works, built in the 1930's, will be demolished. The new facilities, will serve a population of 47,500, and may be expanded to serve twice that number of people. On the basis of these tests, a double filtration system has been manufactured. This includes three 14/16 inch variable speed drive centrifugal pumps, three 14/16 inch main feed pumps, two 4-inch vortex grit pumps, as well as screening disintegrators, screw pumps, screens, grit air blowers, and a standby generator. (Kramer-FIRL)

W76-02194

SEWER PIPE RUN PASSES DEFLECTOMETER TESTS.
Water and Sewage Works, Vol 122, No 9, p 68-69, September 1975, 8 fig.

Descriptors: *Sewers, *Pipelines, *Plastic pipes, Construction materials, On-site tests, Analytical techniques, Engineering, Waste discharge, Virginia.
Identifiers: Deflectometer, Gravity sewers.

A 900-ft run of ten-inch PVC gravity sewer pipe installed near Fredericksburg, Virginia, was field tested to assure that it met the engineering requirement of ten percent maximum deflection. Tests were carried out with a new electronic deflectometer designed and produced by HMJ Manufacturing and Sales. For this sewer line, which is part of a county-wide $5.5 million sewer and treatment project, the maximum PVC pipe deflection was found to be six percent. Average vertical deflections ranged from 2 to 3%; horizontal deflections tended to be lower. This sewer pipe has burial depths ranging from 27 to 39 ft, and the tested section originated near a recently-expanded pumping station. The pipe runs 4000 feet to discharge into an existing ten-inch line. (Kramer-FIRL)
W76-02200

PLASTIC PIPE USE GROWS FOR SEWER MAIN INSTALLATIONS.
The American City and County, Vol 90, No 10, p 84, 86, October, 1975. 1 tab.

Descriptors: *Construction materials, *Sewers, *Pipes, *Plastic pipes, Installations, Surveys, Concrete pipes, Cities.
Identifiers: Vitrified clay pipes.

A survey on construction materials for sewer pipes showed that 19.3% of 1974 installations and an anticipated 18% of the 1975 installations were made with plastic pipe. Mileage of current sewer pipes are listed by type and by size range. The most common inplace sewer pipe material is vitrified clay pipe, followed by reinforced concrete, asbestos concrete, cast iron, and plastic. In recent installations, however, plastic pipe was the second most frequently used type, next to vitrified clay. Annual installations of over 16,500 miles of sewer pipe in the United States are predicted for the next five years, particularly in small cities and in southern and western communities. (Kramer-FIRL)

SEWER AUGERING MACHINE,
L. H. Silverman, A. A. Silverman, and E. T. Goworski.
Canadian Patent 974,010, Issued September 9, 1975. Patent Office Record, Vol 103, No 36, p 3, September, 1975.

Descriptors: *Sewers, *Pipes, *Cleaning, *Patents, Equipment, Plumbing, Waste water treatment.
Identifiers: Plumbing snakes.

A patent has been issued for a plumber snake apparatus that consists of a snake coiled inside of a changeable snake cartridge housed in a cartridge housing. A handgrip at the forward end of the housing is provided for gripping the tool as the snake within the pipe being cleaned is rotated with the housing. When the handgrip is axially displaced rearward, a chuck is automatically actuated to grip the snake and prevent further axial feed. (Orr-FIRL)

SELECTING AND INSTALLING SYNTHETIC POND LININGS,
Van Scoyco and Wiskup, Inc., Washington, D.C.
J. Kumar, and J. A. Jedlicka.
Chemical Engineering, Vol 80, No 3, p 67-70, 1973. 4 fig, 1 tab, 10 ref.

Descriptors: *Ponds, *Linings, *Protective coatings, Impervious membranes, Plastics, Rubber, Synthetic rubber, Installation, Installation costs.
Identifiers: Selection criteria, Polyvinyl chloride, Polyethylene, Polypropylene, Nylons.

Ponds used for waste disposal, brine evaporation, water storage, drilling mud, or chemical storage can be lined with flexible synthetic membranes to prevent excessive liquid seepage into the ground. Synthetic materials are classified as rubber or plastic. Polyvinyl chloride, natural rubber, butyl rubber, Du Pont Hypalon, polyethylene, chlorinated polyethylene, nylon, neoprene, polypropylene, and ethylene propylene rubber are used. Characteristics of each material are given. Liners should have high tensile strength, be flexible, stretch without failure, have good weatherability, have long life, be immune to microbial attack, have specific gravities above 1, be black to resist ultraviolet rays, have a minimum thickness of 20 mils of uniform composition, be free from imperfections, withstand temperature and other ambient conditions, be easily repaired, and economical. A guide to planning, installing, surfacing, sloping, trenching, laying, joining, and covering is given. Where toxic or polluting chemicals are stored, leak detection systems are suggested. The costs of lining materials vary from 10 cents to 60 cents/sq ft and installation cost varies from 1 cent to 10 cent/sq ft.

CHANGE IN MINNOW POPULATIONS IN A SMALL DESERT STREAM RESULTING FROM NATURALLY AND ARTIFICIALLY INDUCED FACTORS,
Bureau of Reclamation, Denver, Colo. Lower River Basin Research Lab.; and Arizona State Univ., Tempe. Dept. of Zoology.
J. N. Rinne.
Southwester Naturalist, Vol 20, No 2, p 185-195, June 27, 1975. 5 tab, 21 ref.

Descriptors: *Fish populations, *Fish reproduction, *Standing crops, *Ecology, *Fish management, Streams, Fish, Minnows, Creeks, Environmental effects, *Arizona, Streamflow, Spawning, Electro-fishing, Flooding, Biomass.
Identifiers: *Population dynamics, Gila intermedia(Girard), Rhinichthys o. osculus(Girard), Agosia chrysogaster(Girard), Cyprinid, Gila River(Ariz).

Population dynamics and standing crops of nows were examined in a small Upper Soo stream in Arizona between 1969 and 1971. T species of minnows, two native to the wash, intermedia (Girard), and Rhinichthys o. osc (Girard), and one introduced (although nativ Arizona), Agosia chrysogaster (Girard), inhab the stream. When a program was initiated in to establish two rare and endangered cypri into a major tributary of the creek, it was sidered desirable to reduce the large populatio Agosia. Renovation was performed follo removal of numbers of Gila and Rhinichthy electrofishing for return to the stream after de ification., Within a week the native fishes were troduced and the two endangered species rele into the habitat. Agosia, not completely destro immediately began spawning to repopulate creek. This procedure was repeated in Febru 1971. Resultant changes in species composit population structure, and standing crops were amined with reference to renovation and inhe environmental factors. Statistics from yea year, attributable to species hardiness, increa streamflow, and flooding. Consistent yearly terms of change in length, weight, and biomas all three species occurred. Condition (k) did display parallel trends among species. (M Arizona)

CONNECTICUT RIVER
Thermal Effects on the Microbiology and Chemistry of the Connecticut River-A Summary,
W76-02014 5C

CONSERVATION
Making Environmental Legislation Work,
W76-02093 6E

CONSTITUTIONAL LAW
No Waiver of Sovereign Immunity 'Implied from States' Entrance into a Federally Regulated Area Unless There Exists an Express Private Right of Action Against the State,
W76-02095 6E

Central Colorado Water Conservancy District V. Colorado River Water Conservation District (Cancellation of Conditional Decree when District Refused to Comply with Facility Construction Statute).
W76-02106 6E

CONSTRUCTION
Flood Damage--Creates Act to Prevent.
W76-02086 6E

Talbot v. Gray (Lakeside Dock A Permitted Accessory Use Within Zoning Ordinance).
W76-02108 6E

State v. Burton (No Damages Inverse Eminent Domain or Highway Construction Not Cause of an Altered Drainage Pattern).
W76-02125 6E

Putnam v. Carroll (Shoreline Management Act).
W76-02131 6E

Laser Tunnelling Guidance System.
W76-02177 8G

Backhoe and Loader Team Up on Unusual Sewage System.
W76-02204 8C

CONSTRUCTION EQUIPMENT
Big Backhoe Boosts Sewer Footages.
W76-02203 8C

LIBRARY U. OF I. URBANA CHAMPAIGN

ONSTRUCTION MATERIALS
A Fail-Safe Subaqueous Concrete Sewer,
W76-02171 8F

Plastic Pipe Use Grows for Sewer Main Installations.
W76-02202 8G

ONTAMINANT LEVELS
Safe Drinking Water Act.
W76-02078 5F

ONTRACTS
Bruegman v. Johnson Ranches, Inc. (Abandonment of Water Rights and the Carey Act).
W76-02117 6E

Gallup Gamerco Coal Company v. Irwin (Application of Doctrines Relating to Oil and Gas Leases to the Lease of Water Well).
W76-02124 6E

ONTROL SYSTEMS
Sewage Disposal Plant with Automatic Control System.
W76-02196 5D

ONVECTION
Investifation of Vertical Mixing in the Dispersion of Pollutants in Lake Erie,
W76-02152 5B

OOLING TOWER BLOWDOWN
Industrial Wastewater Reclamation,
W76-02450 5D

OOLING TOWERS
Improvement of the Environmental and Economic Characteristics of Cooling Towers: Part I of II. Heat Rejection from Horizontal Tubes to Shallow Fluidized Beds,
W76-02381 5G

OOLING WATER
Water Resource Alternatives for Power Generation in Arizona,
W76-02243 3E

Effects of Entrainment of Zooplankton at Three Mid-Atlantic Power Plants,
W76-02315 5C

Waste Water Coolant.
W76-02340 5D

OPEPODS
Critical Thermal Maxima and Upper Lethal Temperatures for the Calanoid Copepods Acartia Tonsa and A. Clausi,
W76-02329 5C

OREGONUS CLUPEAFORMIS
Effect of Different Constant Incubation Temperatures on Egg Survival and Embryonic Development in Lake Whitefish (Coregonus Clupeaformis),
W76-02392 5C

ORN (FIELD)
Soybean and Corn Rooting in Southwestern Minnesota: I. Water-Uptake Sink,
W76-02403 3F

ORROSION CONTROL
New Anticorrosion Coating, 4P, For Drinking Water Tanks on Ships, (In Russian),
W76-02357 5G

OST ANALYSIS
Infiltration--Inflow Analysis,
W76-02170 5D

COST-BENEFIT ANALYSIS
Economics of Great Lakes Bulk Carriers in Winter Operations,
W76-02384 6B

Project Evaluation During Inflation,
W76-02444 6B

COST COMPARISONS
Economic Alternatives in Solving the U.S.-Mexico Colorado River Water Salinity Problem,
W76-02226 3A

COST SHARING
Analysis of Cost Sharing Programs for Pollution Abatement of Municipal Wastewater,
W76-02379 5G

COSTS
Large Diameter Sewer Averages $234.50 Per Lin Ft.
W76-02175 5D

Who Will Pay for Pollution Control.--The Distribution by Income of the Burden of the National Environmental Protection Program, 1972-1980,
W76-02376 5G

Environmental Considerations in Future Energy Growth.
W76-02428 6G

COW BAYOU (TEX)
Hydrologic Data for Cow Bayou, Brazos River Basin, Texas, 1973,
W76-02145 7C

CREEP
Mass-Wasting Processes in Watershed Management,
W76-02287 4C

CROP PRODUCTION
Increasing Forage Production on a Semiarid Rangeland Watershed,
W76-02223 4A

CROSS-SECTIONS
Preferred Position Model and Subsurface Symmetry of Valleys,
W76-02410 2A

CRUDE OIL
Toxicities of Crude Oils and Oil-Dispersant Mixtures to Juvenile Rabbitfish, Siganus Rivulatus,
W76-02322 5C

CRUSTACEANS
Comparative Toxicity of Larval Lampricide (TFM: 3-Trifluoromethyl-4-Nitrophenol) To Selected Benthic Macroinvertebrates,
W76-02330 5C

CRYSTAL RIVER (FLA)
Total Metabolism of Thermally Affected Coastal Systems on the West Coast of Florida,
W76-02021 5C

CUTTHROAT TROUT
The Influence of Temperature on Scope for Activity in Cutthroat Trout, Salmo Clarki,
W76-02388 5C

CYANIDE OXIDATION
Electrolytic Treatment of Job Shop Metal Finishing Wastewater,
W76-02070 5D

CYANOPHYTA
The Phytoplankton of Canyon Lake, Arizona,
W76-02459 5C

DAIRY INDUSTRY
Some Trends in Industrial Water and Wastes Management,
W76-02429 5D

Treatment of Cheese Processing Wastes by the Bio-Disc Process,
W76-02438 5D

DAIRY WASTES
Some Trends in Industrial Water and Wastes Management,
W76-02429 5D

DAMAGES
G and A Contractors, Inc. v. Alaska Greenhouses, Inc. (Siltation of Creek Continuing Trespass Requiring Restoration Measure of Damages).
W76-02121 6E

Jewell v. Kroo (Replacement of Dam Right of Owners of Water Easement Where Larger Reservoir Required).
W76-02123 6E

DAMS
ERTS-1 Data in Support of the National Program of Inspection of Dams,
W76-02029 7C

Fullenwider v. Bagwell (Wide Court Discretion in Shaping Injunctive Relief for Plaintiff's Uncontested Water Right).
W76-02110 6E

Jewell v. Kroo (Replacement of Dam Right of Owners of Water Easement Where Larger Reservoir Required).
W76-02123 6E

DANE COUNTY (WIS)
A Digital-Computer Model for Estimating Drawdowns in the Sandstone Aquifer in Dane County, Wisconsin,
W76-02498 4B

DATA COLLECTIONS
Water Quality Monitoring and River Basin Planning: A Critique and Some Recommendations,
W76-02378 5A

Use of Areal Snow Cover Measurements to Develop Snowmelt-Runoff Relationships for Arizona,
W76-02453 2C

Water Temperature-Influential Factors, Field Measurement, and Data Presentation,
W76-02494 2K

DATA PROCESSING
ERTS-1 Data in Support of the National Program of Inspection of Dams,
W76-02029 7C

Techniques for Computer-Aided Analysis of ERTS-1 Data, Useful in Geologic, Forest and Water Resource Surveys,
W76-02053 7C

Advanced Processing and Information Extracting Techniques Applied to ERTS-1 MSS Data,
W76-02057 7C

Interpretation of ERTS-1 Imagery Aided by Photographic Enhancement,
W76-02058 7C

A Technique for Correcting ERTS Data for Solar and Atmospheric Effects,
W76-02059 7C

The Penn State Orser System for Processing and Analyzing ERTS Data,
W76-02060 7C

ERTS Image Data Compression Technique Evaluation,
W76-02061 7C

Evaluation of Digitally Corrected ERTS Images,
W76-02062 7C

Automated Thematic Mapping and Change Detection of ERTS-1 Images,
W76-02063 7B

Principal Components Colour Display of ERTS Imagery,
W76-02064 7C

Scene Correction (Precision Processing) of ERTS Sensor Data Using Digital Image Processing Techniques,
W76-02066 7C

Spectral and Textural Processing of ERTS Imagery,
W76-02067 7C

Digital Image Enhancement Techniques Used in Some ERTS Application Problems,
W76-02068 7C

Water Temperature-Influential Factors, Field Measurement, and Data Presentation,
W76-02494 2K

Computerized Reduction of Meteorologic Measurements from Irrigated and Nonirrigated Plots in Central Utah,
W76-02500 7C

DD
Hygienic Standardization of DD and DDB Compounds in Water Bodies, (In Russian),
W76-02406 5B

DDB
Hygienic Standardization of DD and DDB Compounds in Water Bodies, (In Russian),
W76-02406 5B

DEBRIS AVALANCHES
The Hydrology of Chaparral Watersheds,
W76-02286 4D

DECIDUOUS FORESTS
Simulation of Evapotranspiration and Drainage from Mature and Clear-Cut Deciduous Forests and Young Pine Plantation,
W76-02426 2D

DECISION MAKING
Analysis of a Multipurpose Water Resource System in Southeastern Mexico,
W76-02157 6A

A Graphical Procedure for Classifying Aquifer Management Strategy,
W76-02159 4B

Boise Post-Audit Study, Plan of Study Subproject Report,
W76-02373 6B

DECOMPOSING ORGANIC MATTER
Decomposition and Disappearance of Organic Debris in Three Replicate Streams with Different Nitrate Input,
W76-02001 5B

DEEP RESERVOIR MODELS
Evaluation of Mathematical Models for Temperature Prediction in Deep Reservoirs,
W76-02270 5B

DEEPWATER
Deepwater Port Act of 1974.
W76-02077 6E

DEEPWATER PORT ACT
Deepwater Port Act of 1974.
W76-02077 6E

DEGRADATION
Nondegradation of Water Quality: The Need for Effective Action,
W76-02092 5G

DEHYDROGENASE ACTIVITY
Measurement of Active Biomass Concentrations in Biological Waste Treatment Processes,
W76-02268 5D

DEICERS
Chloride in Natural Waters of New Hampshire,
W76-02361 5B

DELAWARE
Effects of a Thermal Effluent on the American Oyster,
W76-02009 5C

Inventories of Delaware's Coastal Vegetation and Land-Use Utilizing Digital Processing of ERTS-1 Imagery,
W76-02037 7B

Monitoring Coastal Water Properties and Current Circulation with ERTS-1,
W76-02044 7B

DELAWARE BAY
Monitoring Coastal Water Properties and Current Circulation with ERTS-1,
W76-02044 7B

DELHI (NY)
Floodflow Characteristics at Proposed Bridge Site on West Branch Delaware River, Delhi, New York,
W76-02137 4A

DEMINERALIZATION
Twin Belt Ion Exchange System,
W76-02254 5F

DEMONSTRATION WATERSHEDS
Factor Analysis for Interpretation of Basin Physiography,
W76-02285 2A

DEPARTMENT OF TRANSPORTATION (ILLINOIS)
The Civil Administrative Code (Provisions Relating to Illinois State Agencies Concerned with Waterway Law).
W76-02082 6E

DEPOSITION
Relation of Reservoir Sedimentation to Catchment Attributes, Landslide Potential, Geologic Faults, and Predicted Density,
W76-02288 2J

DESALINATION
Economic Alternatives in Solving the U.S.-Mexico Colorado River Water Salinity Problem,
W76-02226 3A

United States-Mexico Water Agreements an Related Water use in Mexicali Valley: A Sum mary,
W76-02227 3(

Salinity Control Planning in the Colorado Rive System,
W76-02230 3,

Fresh Water for Arizona by Salt Replacemen Desalination,
W76-02231 3,

Cleaning of Membrane Surfaces,
W76-02263 3,

DESALINATION PROCESSES
Fresh Water for Arizona by Salt Replacemen Desalination,
W76-02231 3A

Apparatus for and a Method of Purifying Waste Fluid,
W76-02262 5D

DESERT PLANTS
Some New Aspects of Plant Indication of Hydrogeological Conditions in Deserts, (In Russian),
W76-02003 2I

Sodium Relations in Desert Plants: 3. Cation-Anion Relationships in Three Species Which Accumulate High Levels of Cations in Leaves,
W76-02158 3C

New Concepts on the Water Regime of Plants of the Kara Kum Desert, (In Russian),
W76-02317 2I

Germination Responses of a New Mexico Population of Parry Agave (Agave Parryi Englem. Var. Parry I) To Constant Termperature, Water Stress, and pH,
W76-02456 2I

DESERTS
Some New Aspects of Plant Indication of Hydrogeological Conditions in Deserts, (In Russian),
W76-02003 2I

New Concepts on the Water Regime of Plants of the Kara Kum Desert, (In Russian),
W76-02317 2I

Reclamation by Tubewell Drainage in Rechna Doab and Adjacent Areas, Punjab Region, Pakistan,
W76-02484 4B

DESIGN CRITERIA
Aerobic Stabilization of Waste Activated Sludge - An Experimental Investigation,
W76-02076 5D

Design Seminar for Land Treatment of Municipal Wastewater Effluents. Design Factors, Part I,
W76-02185 5D

Linear Programming Analysis of Branched Pipe Network,
W76-02366 3F

Sour Water Stripper: Its Design and Application,
W76-02436 5D

Design Criteria for High-Purity Oxygen Treatment of Kraft Mill Effluent,
W76-02466 5D

LIBRARY U. OF I. URBANA-CHAMPAIGN

ETERGENTS
Resource Scarcity, Ecnomic Growth and the Environment.
W76-02079 6E

EWATERING
Filter-Press for Drying Waste and Sewage Sludges.
W76-02179 5D

Thickening Activated Sludge from Effluent Treatment Plants.
W76-02184 5D

Best Alternative to Ocean Disposal.
W76-02188 5E

Sludge Dewatering Process and Apparatus,
W76-02210 5D

Method and Apparatus for Processing Refuse, Sewage and/or Waste Material into a Source of Energy,
W76-02214 5D

Anaerobic Digestion of Dairy Farm Slurry,
W76-02292 5D

Traveling Belt Filter Tackles Wastewater.
W76-02295 5D

New Filter Press Enhances Sludge Dewatering Knowhow.
W76-02341 5D

IATOMS
Investigation of Diatom Populations in Rhitron and Potamon Communities in Oak Creek, Arizona,
W76-02458 5A

IATREMES
Preliminary Investigation of the Hydrologic Properties of Diatremes in the Hopi Buttes, Arizona,
W76-02239 4B

IELECTRIC PROPERTIES
Measurements of the Dielectric Properties of Wet Snow Using a Microwave Technique,
W76-02398 2C

IFFUSION
Investifation of Vertical Mixing in the Dispersion of Pollutants in Lake Erie,
W76-02152 5B

Numerical Solution to a Two-Dimensional Dispersion Equation,
W76-02153 5B

Criteria for the Use of Vertical Averaging in Great Lakes Dispersion Models,
W76-02154 5B

Criteria for the Use of Vertical Averaging in Environmental Dispersion Models,
W76-02155 2H

Criteria for the Use of Vertical Averaging in Great Lakes Dispersion Models,
W76-02156 2H

Vertical Patterns of Eddy Diffusion During Stratification in Castle Lake, California,
W76-02414 2H

Determination of Dissolved Gases in Water by Diffusion and Gas Chromatographic Techniques,
W76-02427 5A

DIFFUSIVITY
Numerical Solution to a Two-Dimensional Dispersion Equation,
W76-02153 5B

Criteria for the Use of Vertical Averaging in Environmental Dispersion Models,
W76-02155 2H

DIPTERA
Effects of Thermal Effluents on Fish and Invertebrates,
W76-02018 5C

DISCHARGE
Response of Perch and Their Forage to Thermal Discharges in Lake Ontario,
W76-02015 5C

DISCHARGE (WATER)
Effects of Entrainment of Zooplankton at Three Mid-Atlantic Power Plants,
W76-02315 5C

DISINFECTION
Method and Apparatus for the Disinfection of Liquids by Anodic Oxidation and Preceding Reduction,
W76-02251 5F

DISPERSION
Criteria for the Use of Vertical Averaging in Great Lakes Dispersion Models,
W76-02154 5B

Criteria for the Use of Vertical Averaging in Environmental Dispersion Models,
W76-02155 2H

Criteria for the Use of Vertical Averaging in Great Lakes Dispersion Models,
W76-02156 2H

DISPERSION MODELS
Investifation of Vertical Mixing in the Dispersion of Pollutants in Lake Erie,
W76-02152 5B

DISPOSAL
Potential Environmental Problems of Dredging and Dredged Material Disposal: Dredged Material Disposal Criteria,
W76-02449 5C

DISPOSAL OF DREDGED MATERIAL
Disposal of Dredged Material in Navigable or Ocean Waters.
W76-02099 5E

DISSOLVED AIR FLOTATION
Treatment of Combined Sewer Overflows by Dissolved Air Flotation,
W76-02074 5D

DISSOLVED GASES
Determination of Dissolved Gases in Water by Diffusion and Gas Chromatographic Techniques,
W76-02427 5A

DISSOLVED OXYGEN
The Role of Tidal Mixing in Rupert and Holberg Inlets, Vancouver Island,
W76-02413 2L

A Numerical Model of Material Transport in Salt-Wedge Estuaries, Part II. Model Computation of Salinity and Salt-Wedge Dissolved Oxygen in the Duwamish River Estuary, King County, Washington,
W76-02482 2L

DISSOLVED SOLIDS
Method and Apparatus for Continuous Monitoring of Dissolved Organics,
W76-02213 5A

DISTRIBUTION
Who Will Pay for Pollution Control.--The Distribution by Income of the Burden of the National Environmental Protection Program, 1972-1980,
W76-02376 5G

DISTRIBUTION PATTERNS
Numerical Solution to a Two-Dimensional Dispersion Equation,
W76-02153 5B

Critical Thermal Maxima and Upper Lethal Temperatures for the Calanoid Copepods Acartia Tonsa and A. Clausi,
W76-02329 5C

DISTRICT OF COLUMBIA.
Selected Cases of Convective Precipitation Caused by the Meteropolitan Area of Washington, D.C.,
W76-02422 2B

DITCHES
Shrull v. Rapasardi (Rights of Owner as to Ditch Excavated Over Another's Private Lands).
W76-02122 6E

DIVERSION
Water Rights Laws in the Nineteen Western States, Vol I,
W76-02105 6E

Watchorn Basin Association v. Oklahoma Gas and Electric Company (Electric Company's Acquistion of Land Not a Pre-requisite for Water Application to Water Resources Board).
W76-02107 6E

DOCKS
Talbot v. Gray (Lakeside Dock A Permitted Accessory Use Within Zoning Ordinance).
W76-02108 6E

DOMESTIC WATER
Safe Drinking Water Act PL93-523--(Legislative History).
W76-02090 5F

DOMINANT LAND
Shrull v. Rapasardi (Rights of Owner as to Ditch Excavated Over Another's Private Lands).
W76-02122 6E

DONNER LAKE (CALIF)
Limnological Data for Donner Lake, California, May 1973 Through December 1973,
W76-02487 2H

DRAG
Surface Roughness Effects on the Mean Flow Past Circular Cylinders,
W76-02402 8B

DRAG COEFFICIENTS
Surface Roughness Effects on the Mean Flow Past Circular Cylinders,
W76-02402 8B

DRAINAGE
Counties (Provisions of Illinois Statutes Relating to County Jurisdiction Over Waters and Waterways).
W76-02089 6E

LIBRARY OF THE URBANA-CHAMPAIGN

DRAINAGE

State v. Burton (No Damages Inverse Eminent Domain or Highway Construction Not Cause of an Altered Drainage Pattern).
W76-02125 6E

Simulation of Evapotranspiration and Drainage from Mature and Clear-Cut Deciduous Forests and Young Pine Plantation,
W76-02426 2D

DRAWDOWN

A Digital-Computer Model for Estimating Drawdowns in the Sandstone Aquifer in Dane County, Wisconsin,
W76-02498 4B

DREDGE SPOIL

Potential Environmental Problems of Dredging and Dredged Material Disposal: Dredged Material Disposal Criteria,
W76-02449 5C

DREDGING

Disposal of Dredged Material in Navigable or Ocean Waters.
W76-02099 5E

Potential Environmental Problems of Dredging and Dredged Material Disposal: Dredged Material Disposal Criteria,
W76-02449 5C

DRIP IRRIGATION

Drip Irrigation System and Components Thereof,
W76-02249 3F

Method and Apparatus for Controlled Drip Irrigation from Chamber Means Located at Varying Elevations Along Soil Areas to be Irrigated,
W76-02256 3F

DRY CREEP

Mass-Wasting Processes in Watershed Management,
W76-02287 4C

DRY RAVEL

The Hydrology of Chaparral Watersheds,
W76-02286 4D

DRYING

Removes Moisture from Waste Products.
W76-02296 5D

DULUTH (MINN)

Aircraft and Satellite Monitoring of Water Quality in Lake Superior Near Duluth,
W76-02051 5A

DUWAMISH RIVER ESTUARY (WASH)

A Numerical Model of Material Transport in Salt-Wedge Estuaries, Part II. Model Computation of Salinity and Salt-Wedge Dissolved Oxygen in the Duwamish River Estuary, King County, Washington,
W76-02482 2L

EARTH RESOURCES TECHNOLOGY SATELLITES

Use of Areal Snow Cover Measurements to Develop Snowmelt-Runoff Relationships for Arizona,
W76-02453 2C

EASEMENTS

Shrull v. Rapasardi (Rights of Owner as to Ditch Excavated Over Another's Private Lands).
W76-02122 6E

Jewell v. Kroo (Replacement of Dam Right of Owners of Water Easement Where Larger Reservoir Required).
W76-02123 6E

EAST GERMANY

Sanitary-Virological Study of Surface Waters. (In Russian),
W76-02221 5C

ECHO LOCATION

Fish Behavior at a Thermal Discharge into Lake Michigan,
W76-02012 5C

ECOLOGY

Thermal Ecology.
W76-02004 5C

Applications of ERTS Data to Coastal Wetland Ecology with Special Reference to Plant Community Mapping and Typing and Impact of Man,
W76-02036 7B

Boise Post-Audit Study, Economic and Ecological History Support Study,
W76-02374 6B

Change in Minnow Populations in a Small Desert Stream Resulting from Naturally and Artificially Induced Factors,
W76-02460 8I

ECONOMIC FEASIBILITY

The Demand for Agricultural Water in Utah,
W76-02383 6D

ECONOMIC JUSTIFICATION

The Economic Value of Remote Sensing of Earth Resources from Space: An ERTS Overview and the Value of Continuity of Service. Vol. V. Inland Water Resources.
W76-02382 6B

ECONOMICS

Boise Post-Audit Study, Economic and Ecological History Support Study,
W76-02374 6B

EDDY DIFFUSIVITY

Vertical Patterns of Eddy Diffusion During Stratification in Castle Lake, California,
W76-02414 2H

EELS

Proliferations in the Fish Epidermis after Treatment with Glycolysis Inhibitors, (Proliferationen der Fishepidermis nach der Einwirkung von Inhibitoren des Glykolytischen Energiestoffwechsels),
W76-02387 5C

EFFLUENT STANDARDS

A Quantitative Method for Effluent Compliance Monitoring Resource Allocation,
W76-02269 5G

EFFLUENTS

Phosphate Manufacturing Point Source Category-Effluent Guidelines and Standards.
W76-02103 5G

Isolation and Identification of Constituents Toxic to Juvenile Rainbow Trout (Salmo Gairdneri) in Caustic Extraction Effluents from Kraft Pulpmill Bleach Plants,
W76-02332 5A

Effluent Treatment Plant.
W76-02348 5D

EGYPT

A Suitability Index of Drainage Waters for I rigation Purposes,
W76-02168 3C

ELECTRIC FIELDS

A Stochastic Electrical Model of an Infinit Cloud: Charge Generation and Precipitatio Development,
W76-02404 2I

ELECTRIC POWER PLANTS

Watchorn Basin Association v. Oklahoma Ga and Electric Company (Electric Company' Acquistion of Land Not a Pre-requisite fo Water Application to Water Resources Board).
W76-02107 6I

ELECTRIC POWER PRODUCTION

Water Resource Alternatives for Power Generation in Arizona,
W76-02243 3E

ELECTRICAL CHARGE GENERATION

A Stochastic Electrical Model of an Infinite Cloud: Charge Generation and Precipitation Development,
W76-02404 2B

ELECTRICAL PROPERTIES

Measurements of the Dielectric Properties of Wet Snow Using a Microwave Technique,
W76-02398 2C

ELECTRO-M-PROCESS

Electrochemical process for Effluent,
W76-02313 5D

ELECTROCHEMICAL TREATMENT

Electrolytic Treatment of Job Shop Metal Finishing Wastewater,
W76-02070 5D

Electrochemical process for Effluent,
W76-02313 5D

ELECTRODES

Measurement of the Apparent PH of Seawater with a Combination Microelectrode,
W76-02415 2L

ELECTROLYSIS

Electrolytic Treatment of Job Shop Metal Finishing Wastewater,
W76-02070 5D

ELECTROPLATING WASTES

Reaction of Non-Cyanidic Metal Complexes to Conventional Decontamination of Waste Water From Electro-Plating (Das Verhalten Nicht-Cyanidischer Metallkomplexe Bei Der Herkoemmlichen Entgiftung Von Galvanikabwaessern),
W76-02347 5D

ELEVATION

Topographical Effects on Standard Normals of Rainfall Over Israel,
W76-02499 2B

EMPIRICAL RELATION

An Empirical Description of Wall Jet Velocity Profiles,
W76-02407 8B

ENERGY CONVERSION

Environmental Considerations in Future Energy Growth.
W76-02428 6G

ERGY TRANSFER
Horizontal Turbulent Energy Transfer Associated with a Great Lakes Coastal Current,
W76-02411 2H

TRAINMENT
Plankton Entrainment by the Condenser Systems of Nuclear Power Stations on Lake Ontario,
W76-02011 5C

Effects of Entrainment of Zooplankton at Three Mid-Atlantic Power Plants,
W76-02315 5C

Turbulent Dense Plumes in a Laminar Cross Flow,
W76-02418 8B

VIRONMENT
Application of ERTS Imagery to Environmental Studies of Lake Champlain,
W76-02034 7B

Applications of ERTS-1 Imagery to Terrestrial and Marine Environmental Analyses in Alaska,
W76-02049 7B

VIRONMENTAL CONTROL
Deepwater Port Act of 1974.
W76-02077 6E

Coastal Zone Management Program Approval Regulations.
W76-02101 6E

Topologically Random Channel Networks in the Presence of Environmental Controls,
W76-02408 8B

VIRONMENTAL EFFECTS
Thermal Ecology.
W76-02004 5C

Synergistic Effects of Temperature and Other Environmental Parameters on Organisms,
W76-02007 5C

Effects of a Thermal Effluent on the American Oyster,
W76-02009 5C

Thermal Effects on the Microbiology and Chemistry of the Connecticut River-A Summary,
W76-02014 5C

Effects of Thermal Effluents on Fish and Invertebrates,
W76-02018 5C

Environmental Studies of an Arctic Estuarine System,
W76-02075 2L

Resource Scarcity, Ecnomic Growth and the Environment.
W76-02079 6E

Disposal of Dredged Material in Navigable or Ocean Waters.
W76-02099 5E

Guidelines for Review of Fish and Wildlife Aspects of Proposals in or Affecting Navigable Waters.
W76-02102 6E

Putnam v. Carroll (Shoreline Management Act).
W76-02131 6E

Canyon Creek Management Analysis,
W76-02242 4C

Environmental Considerations in Future Energy Growth.
W76-02428 6G

Germination Responses of a New Mexico Population of Parry Agave (Agave Parryi Englem. Var. Parry I) To Constant Termperature, Water Stress, and pH,
W76-02456 2I

ENVIRONMENTAL IMPACT STATEMENT
Coastal Zone Management Program Approval Regulations.
W76-02101 6E

Guidelines for Review of Fish and Wildlife Aspects of Proposals in or Affecting Navigable Waters.
W76-02102 6E

ENVIRONMENTAL POLICY
Making Environmental Legislation Work,
W76-02093 6E

ENVIRONMENTAL PROTECTION AGENCY
Safe Drinking Water Act.
W76-02078 5F

ENVIRONMENTAL QUALITY
A Hydronomic Analysis of Forest Management Alternatives for Environmental Quality: A Case Study of Itasca County,
W76-02362 6B

ENZYMES
Measurement of Active Biomass Concentrations in Biological Waste Treatment Processes,
W76-02268 5D

EPIDEMIOLOGY
Sanitary-Virological Study of Surface Waters, (In Russian),
W76-02221 5C

EPILIMNION
Limnological Data Report for the Maine Department of Environmental Protection--U.S. Geological Survey Cooperative Lake Studies Project,
W76-02492 7C

EQUIPMENT
Sewer Lining--The Toronto Technique,
W76-02172 8G

EQUITABLE APPORTIONMENT
Analysis of Cost Sharing Programs for Pollution Abatement of Municipal Wastewater,
W76-02379 5G

EROSION
Study and Survey of Lake Michigan Shoreline.
W76-02087 6E

Forest Management Impacts on Cold Water Fisheries,
W76-02274 4C

Relation of Reservoir Sedimentation to Catchment Attributes, Landslide Potential, Geologic Faults, and Predicted Density,
W76-02288 2J

Sedimentation and Turbidity Hazards in Wildlands,
W76-02289 2J

Relative Contribution of Sediment from Source Areas and Transport Processes,
W76-02290 2J

EROSION CONTROL
County Sediment Control Programs (194 Amendments).
W76-02127 6E

Management of Mountain Watersheds.
W76-02169 4D

EROSION RATES
Applicability of the Universal Soil Loss Equation to Semiarid Rangeland Conditions in the Southwest,
W76-02222 2J

A Photographic Technique for Monitoring Erosion on Strip Mined Lands,
W76-02278 5A

ERTS
Mapping Snow Extent in the Salt-Verde Watershed and the Southern Sierra Nevada Using Erts Imagery,
W76-02027 7B

Snow-Extent Mapping and Lake Ice Studies Using ERTS-1 MSS Together with NOAA-2 VHRR,
W76-02028 7B

ERTS-1 Data in Support of the National Program of Inspection of Dams,
W76-02029 7C

Dynamics of Playa Lakes in the Texas High Plains,
W76-02030 7B

Measuring Watershed Runoff Capability with ERTS Data,
W76-02031 7C

Retransmission of Water Resources Data Using the ERTS-1 Data Collection System,
W76-02032 7B

ERTS-1 Flood Hazard Studies in the Mississippi River Basin,
W76-02033 7B

Application of ERTS Imagery to Environmental Studies of Lake Champlain,
W76-02034 7B

A Real Time Data Acquisition System by Satellite Relay,
W76-02035 7B

Applications of ERTS Data to Coastal Wetland Ecology with Special Reference to Plant Community Mapping and Typing and Impact of Man,
W76-02036 7B

Inventories of Delaware's Coastal Vegetation and Land-Use Utilizing Digital Processing of ERTS-1 Imagery,
W76-02037 7B

Evaluation of Remote Sensing and Automatic Data Techniques for Characterization of Wetlands,
W76-02038 7C

Relationships Between ERTS Radiances and Gradients Across Oceanic Fronts,
W76-02039 7B

Ocean Internal Waves Off the North American and African Coasts from ERTS-1,
W76-02040 7B

A Review of Initial Investigations to Utilize Erts-1 Data in Determining the Availability and Distribution of Living Marine Resources,
W76-02041 7B

Updating Coastal and Navigational Charts Using ERTS-1 Data,
W76-02042 7B

Sediment Concentration Mapping in Tidal Estuaries,
W76-02043 7B

Monitoring Coastal Water Properties and Current Circulation with ERTS-1,
W76-02044 7B

California Coastal Processes Study,
W76-02045 7B

The Utilization of ERTS-1 Data for the Study of the French Atlantic Littoral,
W76-02046 7B

Monitoring Arctic Sea Ice Using ERTS Imagery,
W76-02047 7B

Applicability of ERTS to Antaractic Iceberg Resources,
W76-02048 7B

Applications of ERTS-1 Imagery to Terrestrial and Marine Environmental Analyses in Alaska,
W76-02049 7B

An Interdisciplinary Study of the Estuarine and Coastal Oceanography of Block Island Sound and Adjacent New York Coastal Waters,
W76-02050 7B

Aircraft and Satellite Monitoring of Water Quality in Lake Superior Near Duluth,
W76-02051 5A

Quantitative Water Quality with ERTS-1,
W76-02052 5A

Techniques for Computer-Aided Analysis of ERTS-1 Data, Useful in Geologic, Forest and Water Resource Surveys,
W76-02053 7C

Multispectral Combination and Display of ERTS-1 Data,
W76-02054 7C

Affine Transformations from Aerial Photos to Computer Compatible Tapes,
W76-02055 7C

ESIAC: A Data Products System for ERTS Imagery (Time-Lapse Viewing and Measuring),
W76-02056 7C

Advanced Processing and Information Extracting Techniques Applied to ERTS-1 MSS Data,
W76-02057 7C

Interpretation of ERTS-1 Imagery Aided by Photographic Enhancement,
W76-02058 7C

A Technique for Correcting ERTS Data for Solar and Atmospheric Effects,
W76-02059 7C

The Penn State Orser System for Processing and Analyzing ERTS Data,
W76-02060 7C

ERTS Image Data Compression Technique Evaluation,
W76-02061 7C

Evaluation of Digitally Corrected ERTS Images,
W76-02062 7C

Automated Thematic Mapping and Change Detection of ERTS-1 Images,
W76-02063 7B

Principal Components Colour Display of ERTS Imagery,
W76-02064 7C

Application of ERTS Data to Resource Surveys of Alaska,
W76-02065 7C

Scene Correction (Precision Processing) of ERTS Sensor Data Using Digital Image Processing Techniques,
W76-02066 7C

Spectral and Textural Processing of ERTS Imagery,
W76-02067 7C

Digital Image Enhancement Techniques Used in Some ERTS Application Problems,
W76-02068 7C

ERTS-1 IMAGERY

Use of Areal Snow Cover Measurements to Develop Snowmelt-Runoff Relationships for Arizona,
W76-02453 2C

ESTIMATING EQUATIONS

Applicability of the Universal Soil Loss Equation to Semiarid Rangeland Conditions in the Southwest,
W76-02222 2J

Uncertainty in Sediment Yield From A Semi-Arid Watershed,
W76-02240 2J

ESTUARIES

Effect of Thermal Effluents on the Marine Biology of Southeastern Florida,
W76-02023 5C

Sediment Concentration Mapping in Tidal Estuaries,
W76-02043 7B

Monitoring Coastal Water Properties and Current Circulation with ERTS-1,
W76-02044 7B

An Interdisciplinary Study of the Estuarine and Coastal Oceanography of Block Island Sound and Adjacent New York Coastal Waters,
W76-02050 7B

Environmental Studies of an Arctic Estuarine System,
W76-02075 2L

Discharge and Flow Distribution, Columbia River Estuary,
W76-02143 5B

A Numerical Model of Material Transport in Salt-Wedge Estuaries, Part 1. Description of the Model,
W76-02481 2L

A Numerical Model of Material Transport in Salt-Wedge Estuaries, Part II. Model Computation of Salinity and Salt-Wedge Dissolved Oxygen in the Duwamish River Estuary, King County, Washington,
W76-02482 2L

ESTUARINE ENVIRONMENT

Total Metabolism of Thermally Affecte Coastal Systems on the West Coast of Florida
W76-02021 5

ESTUARINE ENVIRONMENTAL

Tidal Flats in Estuarine Water Quality Analysis,
W76-02071 5

ETHYLENE THIOUREA

New Method for the Determination of the Tot BOD Content of Wastewaters (Novyy meto opredeleniya BPK-polnogo stochnykh vod),
W76-02193 5

EUGLENOPHYTA

The Phytoplankton of Canyon Lake, Arizona,
W76-02459 5C

EUPHAUSIIDS

Flux of Cadmium Through Euphausiids,
W76-02327 5C

EUROPE

Ichthyofauna of Certain Rivers in Southern Poland,
W76-02405 5E

EUTROPHICATION

Photosynthetic Activity of Individual Algal Species of the Plankton of Lake Krivoye, (In Russian),
W76-02206 5C

Evaluating a Mathematical Model for Predicting Lake Eutrophication,
W76-02370 5C

EVAPORATION

Assessing Soil-Water Status Via Albedo Measurement,
W76-02224 2D

Estimating Energy Budget Components to Determine Lake Huron Evaporation,
W76-02425 2D

EVAPORATIVE-DRYING TECHNIQUES

Removes Moisture from Waste Products.
W76-02296 5D

EVAPOTRANSPIRATION

Simulation of Evapotranspiration and Drainage from Mature and Clear-Cut Deciduous Forests and Young Pine Plantation,
W76-02426 2D

EVAPOTRANSPIRATION CONTROL

Engineering and Ecological Evaluation of Antitranspirants for Increasing Runoff in Colorado Watersheds,
W76-02368 3B

EXCESS WATER (SOILS)

State v. Burton (No Damages Inverse Eminent Domain or Highway Construction Not Cause of an Altered Drainage Pattern).
W76-02125 6E

EXPLOSIVES

Investigation Related to Prevention and Control of Water Pollution in the U.S. TNT Industry,
W76-02441 5D

Abatement of Nitrobodies in Aqueous Effluents From TNT Production and Finishing Plants,
W76-02442 5D

LIBRARY U. OF I. URBANA-CHAMPAIGN

TOR ANALYSIS
actor Analysis for Interpretation of Basin hysiography,
76-02285 2A

ARDO-LUQUILLO AREA (PR)
oods in the Fajardo-Luquillo Area, ortheastern Puerto Rico,
76-02150 7C

M WASTES
ater Quality Control Through Single Crop gricultural, No 4,
76-02272 5G

acterial Contents of Sewage from Large Hog arms in Romania, (In France),
76-02401 5A

HEAD MINNOWS
he Relationship of the 96-Hour LC50 to the ethal Threshold Concentration of Hexavalent hromium, Phenol, and Sodium Pentachlorophenate for Fat-Head Minnows imephales Promelas Rafinesque),
76-02325 5C

LTS (GEOLOGIC)
tructural Relations Determined From Interpretation of Geophysical Surveys: Woody ountain Well Field, Coconino County, rizona,
76-02238 4B

SIBILITY
riteria for Determining Feasibility of Rural ater Supply Systems in Livestock Production reas,
76-02367 3F

DERAL GOVERNMENT
laking Environmental Legislation Work,
76-02093 6E

nalysis of Cost Sharing Programs for Pollution Abatement of Municipal Wastewater,
76-02379 5G

DERAL JURISDICTION
eserving Certain Submerged Lands--Presidential Proclamation No 4347.
76-02098 6E

DERAL-STATE WATER RIGHTS NFLICTS
vondale Irrigation District v. North Idaho roperties, Incorporated (Requirement of nited States to Quantify Water Rights for tate Court Adjudication Under McCarran mendment).
76-02111 6E

DERAL WATER POLLUTION CONTROL T
ondegradation of Water Quality: The Need or Effective Action,
76-02092 5G

DERAL WATER POLLUTION CONTROL T AMENDMENTS OF 1972
labama; Navigabel Waters (Proposed Water uality Standards).
76-02100 5G

LTER PRESSES
ilter-Press for Drying Waste and Sewage ludges.
76-02179 5D

ew Filter Press Enhances Sludge Dewatering nowhow.
76-02341 5D

FILTERS
Filter-Press for Drying Waste and Sewage Sludges.
W76-02179 5D

UHR Filters Treating Mill Wastewaters,
W76-02434 5D

FILTRATION
Traveling Belt Filter Tackles Wastewater.
W76-02295 5D

Metal Plater Recovers Toxic Ions.
W76-02352 5D

Filtration Key to Converting Waste Oil Into Usable Fuel.
W76-02359 5D

FIRE
Chaparral Soils,
W76-02282 2G

FISH
Incidence and Cause of Gas-Bubble Disease in a Heated Effluent,
W76-02006 5C

Effects of Thermal Effluents on Fish and Invertebrates,
W76-02018 5C

Ecological Base-Line Study of the Fish of the Anclote Anchorage,
W76-02019 5C

Toxicities of Crude Oils and Oil-Dispersant Mixtures to Juvenile Rabbitfish, Siganus Rivulatus,
W76-02322 5C

Some Effects of Stocking Fish in Waste Treatment Ponds,
W76-02326 5C

Ichthyofauna of Certain Rivers in Southern Poland,
W76-02405 5B

An Evaluation of the Rainbow Trout-Warmwater Species Fishery in Parker Canyon Lake,
W76-02454 2H

Fossil Fishes from the Plicene or Pleistocene Cache Formation, Lake County, California,
W76-02495 2H

FISH BEHAVIOR
Fish Behavior at a Thermal Discharge into Lake Michigan,
W76-02012 5C

Summer Distribution of the Nearshore Fish Community Near A Thermal Generating Station as Determined by Acoustic Census,
W76-02321 5B

FISH FOOD ORGANISMS
Food Habits of Ictalurus Nubulosus in Acid Polluted Water of Northern West Virginia,
W76-02319 5C

FISH HANDLING FACILITIES
Treatability Studies At a Fish Processing Plant, Part Two,
W76-02335 5D

FISH MANAGEMENT
Change in Minnow Populations in a Small Desert Stream Resulting from Naturally and Artificially Induced Factors,
W76-02460 8I

FISH PHYSIOLOGY
Effects of Hypoxia on the Breathing Rate, Heart Rate and Rate of Oxygen Consumption in Fishes,
W76-02334 5C

Proliferations in the Fish Epidermis after Treatment with Glycolysis Inhibitors, (Proliferationen der Fishepidermis nach der Einwirkung von Inhibitoren des Glykolytischen Energiestoffwechsels),
W76-02387 5C

FISH POPULATIONS
Ecological Base-Line Study of the Fish of the Anclote Anchorage,
W76-02019 5C

Summer Distribution of the Nearshore Fish Community Near A Thermal Generating Station as Determined by Acoustic Census,
W76-02321 5B

Change in Minnow Populations in a Small Desert Stream Resulting from Naturally and Artificially Induced Factors,
W76-02460 8I

FISH REPRODUCTION
Change in Minnow Populations in a Small Desert Stream Resulting from Naturally and Artificially Induced Factors,
W76-02460 8I

FISH STOCKING
Some Effects of Stocking Fish in Waste Treatment Ponds,
W76-02326 5C

An Evaluation of the Rainbow Trout-Warmwater Species Fishery in Parker Canyon Lake,
W76-02454 2H

FLOCOR
Treats Huge Flowrates,
W76-02293 5D

FLOOD CONTROL
Counties (Provisions of Illinois Statutes Relating to County Jurisdiction Over Waters and Waterways).
W76-02089 6E

Management of Mountain Watersheds.
W76-02169 4D

FLOOD DATA
Floods in the Fajardo-Luquillo Area, Northeastern Puerto Rico,
W76-02150 7C

FLOOD DISCHARGE
Floodflow Characteristics at Proposed Bridge Site on Mohawk River, Whitesboro, New York,
W76-02136 4A

Floodflow Characteristics at Proposed Bridge Site on West Branch Delaware River, Delhi, New York,
W76-02137 4A

FLOOD IRRIGATION
Irrigation Canal, Water-Withdrawal Weir,
W76-02248 3F

FLOOD PLAIN MAPPING
Flood Plain Mapping: Photogrammetric Data for Hydrology,
W76-02164 7C

FLOOD PLAIN ZONING
Application of Remote Sensing in Floodway Delineation,
W76-02244 7B

FLOOD PLAINS
Floods in the Fajardo-Luquillo Area, Northeastern Puerto Rico,
W76-02150 7C

Flood Plain Mapping: Photogrammetric Data for Hydrology,
W76-02164 7C

FLOOD PROFILES
Floods in the Fajardo-Luquillo Area, Northeastern Puerto Rico,
W76-02150 7C

Flood Plain Mapping: Photogrammetric Data for Hydrology,
W76-02164 7C

FLOOD PROTECTION
Application of Remote Sensing in Floodway Delineation,
W76-02244 7B

Hydrologic Aspects of Land-Use Planning at Tumamoc Hill, Tucson, Arizona,
W76-02245 4A

FLOODING
The Effectiveness of Presowing Flooding of the Rice Fields in KZYL-ORDIA Oblast, (In Russian),
W76-02280 3F

FLOODS
ERTS-1 Flood Hazard Studies in the Mississippi River Basin,
W76-02033 7B

Floods in the Fajardo-Luquillo Area, Northeastern Puerto Rico,
W76-02150 7C

FLORIDA
Ecological Base-Line Study of the Fish of the Anclote Anchorage,
W76-02019 5C

Total Metabolism of Thermally Affected Coastal Systems on the West Coast of Florida,
W76-02021 5C

Effect of Thermal Effluents on the Marine Biology of Southeastern Florida,
W76-02023 5C

Studies of Florida Gulf Coast Salt Marshes Receiving Thermal Discharges,
W76-02024 5C

Potential Use of Vegetation to Enhance Cooling in Holding Ponds,
W76-02025 5C

Air and Water Quality Standards in Florida,
W76-02096 5G

Water Resources Information Needs for the Northwest Florida Water Management District.
W76-02138 4A

Application of Remote Sensing for Prediction and Detection of Thermal Pollution,
W76-02393 5A

FLOTATION
Treatment of Combined Sewer Overflows by Dissolved Air Flotation,
W76-02074 5D

FLOW
A Numerical Model of Material Transport in Salt-Wedge Estuaries, Part 1. Description of the Model,
W76-02481 2L

FLOW AROUND OBJECTS
Surface Roughness Effects on the Mean Flow Past Circular Cylinders,
W76-02402 8B

FLOW EQUALIZATION
Flow Equalization--Plus for Wastewater Treatment Plants.
W76-02191 5D

FLOW RATES
Wheatland Irrigation District v. Two Bar-Muleshoe Water Company (Determination of Irrigation Ditch Capacity to Comply with Seasonal Lease).
W76-02115 6E

Flow Equalization--Plus for Wastewater Treatment Plants.
W76-02191 5D

FLUID MECHANICS
Surface Roughness Effects on the Mean Flow Past Circular Cylinders,
W76-02402 8B

FLUORINE
Proliferations in the Fish Epidermis after Treatment with Glycolysis Inhibitors, (Proliferationen der Fishepidermis nach der Einwirkung von Inhibitoren des Glykolytischen Energiestoffwechsels),
W76-02387 5C

FOOD CHAINS
Environmental Systems Laboratory.
W76-02294 5D

Flux of Cadmium Through Euphausiids,
W76-02327 5C

FOOD PROCESSING INDUSTRY
Removes Moisture from Waste Products.
W76-02296 5D

Peaches Dry-Peeled at Del Monte.
W76-02308 5D

Determining the Chemical Oxygen Demand (COD) of an Industrial Effluent. Comparison of Different Methods Proposed with Special Regard to Certain Substances Contained in Canned Food Industry Generated Waste Waters (Determinazione della domanda chimica di Ossigeno (COD) di un Effluente industriale. Confronto tra i vari metodi proposti con particolare riferimento alle sostanze contenute in Alcuni scarichi delle industrie conserviere).
W76-02309 5D

The Purification Plant of the Animal Flaying Station in Icker-An Example for the Possibilities of the Activation Process and for the Application of Packed Towers with Synthetic Packing Elements (Das Klaerwerk Der Tierkoerperverwerttungsanstalt in Icker-Ein Beispiel Fuer Die Moeglichkeiten Des Belebungsverfahrens Und Fuer Die Des Einsatzes Von Tropfkoerpern Mit Kunststoff-Fuellelementen),
W76-02344 5D

Packing Pickles with Recycled Brine.
W76-02360 5D

FOOD PROCESSING WASTES
Traveling Belt Filter Tackles Wastewater.
W76-02295 5

Overcomes Phosphate Problem,
W76-02297 5

Treatability Studies At a Fish Processing Plan Part Two,
W76-02335 5

FOOD WEBS
Flux of Cadmium Through Euphausiids,
W76-02327 5

FORAGE GRASSES
Increasing Forage Production on a Semiar Rangeland Watershed,
W76-02223 4

FORECASTING
Analog-Model Analysis of Hydrologic Effec of Sewerage in Southeast Nassau an Southwest Suffolk Counties, Long Island, Ne York,
W76-02146 5

Evaluation of Mathematical Models for Tem perature Prediction in Deep Reservoirs,
W76-02270 5

Improving the Statistical Reliability of Strea Heat Assimilation Prediction,
W76-02271 5I

Evaluating a Mathematical Model for Predict ing Lake Eutrophication,
W76-02370 5(

A Digital-Computer Model for Estimatin Drawdowns in the Sandstone Aquifer in Dan County, Wisconsin,

Effect of Different Constant Incubation Temperatures on Egg Survival and Embryonic Development in Lake Whitefish (Coregonus Clupeaformis),
W76-02392 5C

chthyofauna of Certain Rivers in Southern Poland,
W76-02405 5B

ESNO COUNTY (CALIF)
Ground-Water Reconnaissance in the Fresno Northeast Area, Fresno County, California,
W76-02493 4B

ICTION
An Empirical Description of Wall Jet Velocity Profiles,
W76-02407 8B

OTH FLOTATION
Coal Fines Recovered from Water by Froth-Flotation.
W76-02307 5D

H MANAGEMENT
An Evaluation of the Rainbow Trout-Warmwater Species Fishery in Parker Canyon Lake,
W76-02454 2H

MIGANTS
Production, Distribution, Use and Environmental Impact Potential of Selected Pesticides,
W76-02316 5C

Hygienic Standardization of DD and DDB Compounds in Water Bodies, (In Russian),
W76-02406 5B

NGICIDES
Production, Distribution, Use and Environmental Impact Potential of Selected Pesticides,
W76-02316 5C

AGING
Development of a Shallow-Water Wave Direction Gage,
W76-02399 2L

Results from the CERC Wave Measurement Program,
W76-02400 2L

AS-BUBBLE DISEASE
Incidence and Cause of Gas-Bubble Disease in a Heated Effluent,
W76-02006 5C

AS CHROMATOGRAPHY
Determination of Dissolved Gases in Water by Diffusion and Gas Chromatographic Techniques,
W76-02427 5A

ASES
Incidence and Cause of Gas-Bubble Disease in a Heated Effluent,
W76-02006 5C

Determination of Dissolved Gases in Water by Diffusion and Gas Chromatographic Techniques,
W76-02427 5A

GEOLOGIC TIME
Fossil Fishes from the Plicene or Pleistocene Cache Formation, Lake County, California,
W76-02495 2H

GEOMORPHOLOGY
Factor Analysis for Interpretation of Basin Physiography,
W76-02285 2A

Topologically Random Channel Networks in the Presence of Environmental Controls,
W76-02408 8B

GEOPHYSICS
Structural Relations Determined From Interpretation of Geophysical Surveys: Woody Mountain Well Field, Coconino County, Arizona,
W76-02238 4B

GEORGIA
No Waiver of Sovereign Immunity 'Implied from States' Entrance into a Federally Regulated Area Unless There Exists an Express Private Right of Action Against the State,
W76-02095 6E

GEOTHERMAL STUDIES
Geothermal Energy System and Control Apparatus,
W76-02247 4B

Efficient and Nonpolluting Method for Recovering Geothermal Heat Energy,
W76-02255 4B

GERMINATION
Germination Responses of a New Mexico Population of Parry Agave (Agave Parryi Englem. Var. Parry I) To Constant Termperature, Water Stress, and pH,
W76-02456 2I

GOLDFISH
Toxicity of Potassium Permanganate to Fish and its Effectiveness for Detoxifying Antimycin,
W76-02323 5C

GOVERNMENT FINANCES
Boise Post-Audit Study, Economic and Ecological History Support Study,
W76-02374 6B

GOVERNMENTAL CAPACITY
Cherokee Water District v. Colorado Springs (Supplying Water (To a City) Outside the Water District).
W76-02118 6E

GOVERNMENTAL INTERRELATIONS
Waterways, Drainage, Flood Control, Water Pollution and Resources Study Commission.
W76-02083 6E

GRAMA GRASSES
Increasing Forage Production on a Semiarid Rangeland Watershed,
W76-02223 4A

GRANTS
People Ex Rel Gazlay v. Murray (No Conveyance of Underwater Land by Patent When Navigable Waters Fractionalize Land).
W76-02129 6E

GRAPHICAL METHODS
A Graphical Procedure for Classifying Aquifer Management Strategy,
W76-02159 4B

GRAZING
Relation of Reservoir Sedimentation to Catchment Attributes, Landslide Potential, Geologic Faults, and Predicted Density,
W76-02288 2J

LAKE CHAMPLAIN (VT)

Application of ERTS Imagery to Environmental Studies of Lake Champlain,
W76-02034 7B

LAKE COUNTY (CALIF)

Fossil Fishes from the Plicene or Pleistocene Cache Formation, Lake County, California,
W76-02495 2H

LAKE ERIE

Investifation of Vertical Mixing in the Dispersion of Pollutants in Lake Erie,
W76-02152 5B

Numerical Solution to a Two-Dimensio Dispersion Equation.
W76-02153

LAKE EVAPORATION

Estimating Energy Budget Components Determine Lake Huron Evaporation,
W76-02425

LAKE HURON

Estimating Energy Budget Components Determine Lake Huron Evaporation,
W76-02425

LAKE ICE

Snow-Extent Mapping and Lake Ice Stud Using ERTS-1 MSS Together with NOA VHRR,
W76-02028

LAKE MICHIGAN

Fish Behavior at a Thermal Discharge i Lake Michigan,
W76-02012

Updating Coastal and Navigational Cha Using ERTS-1 Data,
W76-02042

Study and Survey of Lake Michigan Shorelin
W76-02087

LAKE MONROE (IND)

A Land Capability Model for the Lower La Monroe Watershed,
W76-02002

LAKE ONTARIO

Plankton Entrainment by the Condens Systems of Nuclear Power Stations on La Ontario,
W76-02011

Response of Perch and Their Forage to Th mal Discharges in Lake Ontario,
W76-02015

Criteria for the Use of Vertical Averaging Great Lakes Dispersion Models,
W76-02156 2

Summer Distribution of the Nearshore Fi Community Near A Thermal Generating St tion as Determined by Acoustic Census,
W76-02321

LAKE SUPERIOR

Aircraft and Satellite Monitoring of Wat Quality in Lake Superior Near Duluth,
W76-02051 5

Horizontal Turbulent Energy Transfer A sociated with a Great Lakes Coastal Current,
W76-02411 2

LAKE WHITEFISH

Effect of Different Constant Incubation Tem peratures on Egg Survival and Embryon Development in Lake Whitefish (Coregon Clupeaformis),
W76-02392 5

LAKES

Dynamics of Playa Lakes in the Texas Hig Plains,
W76-02030 7

Application of ERTS Imagery to Environme tal Studies of Lake Champlain,
W76-02034 7

Surface Water Supply of the United State 1966-70: Part 8. Western Gulf of Mexic

sins--Volume 1. Basins from Mermentau ver to Colorado River.
76-02133 7C

otosynthetic Activity of Individual Algal ecies of the Plankton of Lake Krivoye, (In ssian),
76-02206 5C

Bacterial Water Quality Investigation of nyon Lake,
76-02232 5B

ertical Patterns of Eddy Diffusion During ratification in Castle Lake, California,
76-02414 2H

rface Water Supply of the United States, 66-70: Part 2. South Atlantic Slope and East- n Gulf of Mexico Basins--Volume 1. Basins om James River to Savannah River.
76-02486 7C

imnological Data for Donner Lake, Califor- a, May 1973 Through December 1973,
76-02487 2H

imnological Data Report for the Maine De- artment of Environmental Protection--U.S. eological Survey Cooperative Lake Studies roject,
76-02492 7C

ossil Fishes from the Plicene or Pleistocene ache Formation, Lake County, California,
76-02495 2H

KES ECOSYSTEM MODELS
valuating a Mathematical Model for Predict- g Lake Eutrophication,
76-02370 5C

MELLA SEPARATOR
he Lamella Separator: A Definition and esult of Pilot Studies in the Pulp and Paper nd Steel Industries,
76-02437 5D

MINAR FLOW
urbulent Dense Plumes in a Laminar Cross low,
76-02418 8B

ND CAPABILITY
A Land Capability Model for the Lower Lake Monroe Watershed,
76-02002 4A

ND CLASSIFICATION
A Land Capability Model for the Lower Lake Monroe Watershed,
76-02002 4A

ND DEVELOPMENT
Boise Post-Audit Study, Economic and Ecolog- cal History Support Study,
76-02374 6B

ND MANAGEMENT
Remote Sensing as an Aid to Community Development in an Arid Area,
76-02165 7B

Establishing a Process Framework for Land Use Planning,
76-02241 6A

Hydrologic Aspects of Land-Use Planning at Tumamoc Hill, Tucson, Arizona,
76-02245 4A

LAND SUBSIDENCE
Land Subsidence Due to Ground-Water Withdrawal, Arvin-Maricopa Area, California,
W76-02142 4B

LAND TENURE
Survey Problems Along the California-Arizona Boundary,
W76-02166 4A

LAND TREATMENT
Design Seminar for Land Treatment of Municipal Wastewater Effluents. Design Factors, Part I,
W76-02185 5D

LAND USE
A Land Capability Model for the Lower Lake Monroe Watershed,
W76-02002 4A

Inventories of Delaware's Coastal Vegetation and Land-Use Utilizing Digital Processing of ERTS-1 Imagery,
W76-02037 7B

Establishing a Process Framework for Land Use Planning,
W76-02241 6A

Boise Post-Audit Study, Economic and Ecological History Support Study,
W76-02374 6B

LAND USE PLANNING
Establishing a Process Framework for Land Use Planning,
W76-02241 6A

LANDFILLS
Landfill Stabilization with Leachate Recycle,
W76-02440 5E

LARVAE
Growth and Developmental Responses of Larval Toad Populations to Heated Effluent in a South Carolina Reservoir,
W76-02010 5C

LASERS
Laser Tunnelling Guidance System.
W76-02177 8G

LAW OF THE SEA
The Icelandic Fisheries Dispute: A Decision is Finally Rendered,
W76-02091 6E

LAW OF THE SEA CONFERENCE
Freedom of Scientific Research: Stepchile of the Oceans,
W76-02094 6E

LEACHATE
Landfill Stabilization with Leachate Recycle,
W76-02440 5E

LEAD
The Precipitation of Lead From Waste Waters (Die Ausfaellung Von Blei Aus Abwaessern),
W76-02349 5D

LEAF AREA INDEX
Potential Use of Vegetation to Enhance Cooling in Holding Ponds,
W76-02025 5C

LEASES
Farmers Investment Company v. Pima Mining Company (Sale of Water from Critical Groundwater Area Improper Unless at Auction to Highest Bidder).
W76-02112 6E

Gallup Gamerco Coal Company v. Irwin (Application of Doctrines Relating to Oil and Gas Leases to the Lease of Water Well).
W76-02124 6E

Optimal Leasing Policy for the Development of Outer Continental Shelf Hydrocarbon Resources,
W76-02375 6E

LEAVES
Stomatal Movement and Water Relations in Crops: 2. Stomatal Behavior of Tobacco Leaves of Different Ages and the Influence of Soil Water Shortage, (In Japanese),
W76-02252 2I

LEGAL REVIEW
Fullenwider v. Bagwell (Wide Court Discretion in Shaping Injunctive Relief for Plaintiff's Uncontested Water Right).
W76-02110 6E

LEGISLATION
Chain of Lakes Study Commission and Illinois-Mississippi Canal and Sinnissippi Lake Commision Creates-Effective Date.
W76-02084 6E

Chicago Regional Port District.
W76-02085 6E

National Wild and Scenic Rivers Systems, P.L. 93-279--Legislative History.
W76-02097 6E

Broader Loan Program Introduced for Municipal Sewerage Projects.
W76-02176 6C

The Awakened Interest in the Sewer Ordinance,
W76-02199 5G

LETHAL LIMIT
The Relationship of the 96-Hour LC50 to the Lethal Threshold Concentration of Hexavalent Chromium, Phenol, and Sodium Pentachlorophenate for Fat-Head Minnows (Pimephales Promelas Rafinesque),
W76-02325 5C

Survival and Chloride Ion Regulation of the Porcelain Crab Petrolisthes Armatus Exposed to Mercury,
W76-02328 5C

LETHAL LIMITS
Critical Thermal Maxima and Upper Lethal Temperatures for the Calanoid Copepods Acartia Tonsa and A. Clausi,
W76-02329 5C

LIGNINS
Effect of Ammonium Lignosulfonate on Soil Microorganisms (O vliyanii lignosul'fonata ammoniya na pochvennye mikroorganizmy),
W76-02464 5C

Stability of Lignins in Sulfite Mill Wastewaters to Biochemical Oxidation (Zur Stabilitaet von Sulfitzellstoff- abwasserligninen gegenueber biochemischer Oxydation),
W76-02478 5D

LIGNOSULFONATES
Effect of Ammonium Lignosulfonate on Soil Microorganisms (O vliyanii lignosul'fonata ammoniya na pochvennye mikroorganizmy),
W76-02464 5C

LIMNOLOGY
Limnological Data for Donner Lake, California, May 1973 Through December 1973,
W76-02487 2H

Limnological Data Report for the Maine Department of Environmental Protection--U.S. Geological Survey Cooperative Lake Studies Project,
W76-02492 7C

LINEAR PROGRAMMING
Linear Programming Analysis of Branched Pipe Network,
W76-02366 3F

LININGS
Selecting and Installing Synthetic Pond Linings,
W76-02431 8G

LIQUID WASTES
Method and Apparatus for the Purification of Aqueous Effluent,
W76-02205 5D

Sludge Dewatering Process and Apparatus,
W76-02210 5D

Method and Apparatus for Treatment of Liquid Wastes,
W76-02261 5D

LITTLE BAHAMA BANK
Updating Coastal and Navigational Charts Using ERTS-1 Data,
W76-02042 7B

LITTORINA LITTOREA
Heat Effects on a Marine Snail,
W76-02333 5C

LOANS
Broader Loan Program Introduced for Municipal Sewerage Projects.
W76-02176 6C

LOCAL GOVERNMENTS
Illinois Municipal Code (Provisions Relating to Municipal Jurisdiction OverWaters and Waterways).
W76-02088 6E

The Awakened Interest in the Sewer Ordinance,
W76-02199 5G

LODGEPOLE PINE TREES
Effects of Lodgepole Pine Logging and Residue Disposal on Subsurface Water Chemistry,
W76-02279 5B

LOIRE RIVER
The Utilization of ERTS-1 Data for the Study of the French Atlantic Littoral,
W76-02046 7B

LONG ISLAND (NY)
Analog-Model Analysis of Hydrologic Effects of Sewerage in Southeast Nassau and Southwest Suffolk Counties, Long Island, New York,
W76-02146 5B

LOS ALAMOS (N MEX)
Evaluation of Monitoring of Radioactive Solid-Waste Burial Sites at Los Alamos, New Mexico,
W76-02488 5B

LOUISIANA
Evaluation of Remote Sensing and Automatic Data Techniques for Characterization of Wetlands,
W76-02038 7C

LUMBERING
Mass-Wasting Processes in Watershed Management,
W76-02287 4C

LYSIUM ANDERSONII GRAY
Sodium Relations in Desert Plants: 3. Cation-Anion Relationships in Three Species Which Accumulate High Levels of Cations in Leaves,
W76-02158 3C

MACHIAS-LUBEC AREA (MAINE)
Ground-Water Favorability and Surficial Geology of the Machias-Lubec Area, Washington County, Maine,
W76-02151 7C

MACROALGAE
Effect of Thermal Effluents on the Marine Biology of Southeastern Florida,
W76-02023 5C

MAINE
Ground-Water Favorability and Surficial Geology of the Machias-Lubec Area, Washington County, Maine,
W76-02151 7C

Limnological Data Report for the Maine Department of Environmental Protection--U.S. Geological Survey Cooperative Lake Studies Project,
W76-02492 7C

MALARIA
Water Management Planning for Malaria Prevention in the Damodar Valley, India,
W76-02432 5G

MANAGEMENT
The Civil Administrative Code (Provisions Relating to Illinois State Agencies Concerned with Waterway Law).
W76-02082 6E

Illinois Municipal Code (Provisions Relating to Municipal Jurisdiction OverWaters and Waterways).
W76-02088 6E

MANGROVE SWAMPS
Potential Use of Vegetation to Enhance Cooling in Holding Ponds,
W76-02025 5C

MAPPING
Third Earth Resources Technology Satellite-1 Symposium Volume 1: Technical Presentations, Section B.
W76-02026 7B

Snow-Extent Mapping and Lake Ice Studies Using ERTS-1 MSS Together with NOAA-2 VHRR,
W76-02028 7B

Landsat, A Satellite Surface Water Divining Rod,
W76-02162 7C

Flood Plain Mapping: Photogrammetric Data for Hydrology,
W76-02164 7C

Remote Sensing as an Aid to Community Development in an Arid Area,
W76-02165 7B

MAPS
Updating Coastal and Navigational Cha Using ERTS-1 Data,
